ATCT Siting Study

Trenton-Mercer Airport

Ewing Township, New Jersey

AIRPORT TRAFFIC CONTROL TOWER SITING

FINAL REPORT

Prepared by:

DYConsultants

Effective Date:

March 30, 2022

EXECUTIVE SUMMARY

The current Airport Traffic Control Tower (ATCT) at Trenton-Mercer Airport (TTN) is aged (60 years old), obsolete and needs replacement in the near term. Its location and limited cab floor height present operational issues, such as not permitting air traffic controllers clear and unobstructed views to certain key aircraft movement areas, namely a portion of Taxiway J at the Runway 6 end. Other significant challenges presented by the current facility include constant roof leakages, lack of compliance with the Americans with Disabilities Act (ADA), environmental issues (presence of asbestos and lead-based paint), and other issues associated with a facility well past the end of its design life.

To address these challenges, the County of Mercer County (Airport Sponsor) initiated a project to replace the existing ATCT with a new one. The first phase of the overall project was to conduct a siting study to identify a suitable site for a new ATCT.

In line with draft FAA Order 6480.4C, *Airport Traffic Control Tower Siting Process*, a core team comprised of FAA representatives, the local air traffic manager, TTN senior management, and aviation consultant DY Consultants identified suitable tower sites, analyzed them in detail, and developed recommendations for the most suitable location and height of a new ATCT.

This report documents this siting and evaluation process and defines the various evaluation criteria used in selecting viable sites, reports on the use of 3-D model to validate the sites, describes a Safety Risk Management (SRM) assessment, and presents findings and recommendations.

Recommended Site

Three sites (Sites 1, 2 and 3) were initially identified as 'pre-sites.' Through a detailed assessment by the siting team via 3-D model, Site 1 was eliminated due to Line of Sight (LoS) issues. The remaining two sites (Sites 2 and 3) were designated as 'preferred sites.'

Upon conclusion of the Comparative Safety Assessment (CSA) conducted by the Safety Risk Management Panel (SRMP), **Site 3 was selected as the recommended site**. The site is located in TTN's East quadrant, about 200 ft NNW of an existing Air National Guard hangar complex. The site coordinates are N40°16'34.31", W74°48'29.25". The existing elevation at the site is 180 ft above mean sea level (AMSL).

The proposed controller eye level height is 87 ft Above Ground Level (AGL) and 267 ft AMSL. The proposed Top of Tower (ToT) height is 117 ft AGL (297 ft AMSL). The tower location and height provide unobstructed views of the entire airfield (all movement and critical non-movement areas) and pass all FAA human factor criteria for visibility performance. The SRMP did not identify any hazard for this site.

The proposed ATCT cab is 8-sided with a floor area of approximately 440 sq ft.

Impacts

In accordance with draft FAA Order 6480.4C, and to comply with the requirements of 14 CFR Part 77, an FAA Form 7460-1, *Notice of Proposed Construction or Alteration*, was filed for the two preferred sites. According to the final determination letter reference 2021-AEA-1873-NRA (Appendix F), a new ATCT at the recommended site will have no impacts on navigable airspace. No impacts were identified on the published flight procedures (and the associated TERPS[1]) and Navigational and Visual Aids facilities and equipment.

0.0 INTRODUCTION

0.1. GENERAL INFORMATION ABOUT TRENTON-MERCER AIRPORT

Trenton-Mercer Airport (TTN) is a county-owned public airport located four miles northwest of Trenton, Ewing Township, Mercer County, New Jersey. Designated as a non-hub primary commercial service airport in the National Plan of Integrated Airport Systems (NPIAS), TTN serves scheduled commercial operations and general aviation operations.

According to FAA OPSNET[2] data, TTN had 106,219 aircraft operations in 2019, making it the third busiest towered airport in New Jersey, after Newark Liberty International Airport, Teterboro Airport, and ahead of Atlantic City International Airport. The airport hosts aviation operations for three pharmaceutical companies: Pfizer, Merck and Johnson & Johnson, each having a dedicated hangar and apron on the airport. Other airport tenants include two FBOs: Signature Aviation and FlightServ.

TTN has two crossing runways. Runway 6-24, measuring 6,006 ft long and 150 ft wide, is the primary runway, while Runway 16-34, 4,800 ft long by 150 ft wide, is the crosswind secondary runway. Other key facilities at the airport include several taxiways, aprons, a terminal building, CAT I Instrument Landing Systems (ILS) on Runway 6, Automated Surface Observation System (ASOS), heavy aircraft maintenance facilities, Jet A fueling services, 24-hour aircraft rescue and firefighting service (Index B), and Airport Traffic Control Tower, among others.

0.2. THE NEED FOR A REPLACEMENT AIRPORT TRAFFIC CONTROL TOWER

0.2.1. Overview

The existing ATCT, located near the terminal building ramp off Taxiway A in the West quadrant of the airport, is one of 1,047 ATCTs in the National Airspace System (NAS) and the only tower participating in the Federal Contract Tower (FCT) Program in New Jersey. The TTN tower is operated by Midwest Air Traffic Control Services and is operational from 6:00 AM until 10:00 PM local time.

Figure 1 and **Figure 2** depict the existing ATCT, weather facilities, navigational aids, and other existing and future facilities at the airport.

[2] OPSNET: The Operations Network is the official source of FAA air traffic operations and delay data.

Table 1 Summary of Existing ATCT Characteristics

Item	Value
Coordinates	N40°16'40.22", W74°48'56.35"
Controller Eye Level Height	55± ft
Controller Positions	3
ADA Compliance	Not Compliant

0.2.2. Current Issues

The current ATCT at TTN, built in 1961 (60 years old), is obsolete and needs replacement in the near term. Its location and limited height present the following issues:

- **Poor Line of Sight.** The current tower location and limited height do not allow controllers clear and unobstructed views to certain key aircraft movement areas on the airfield. Controllers have visibility issues from the current tower cab to the southernmost portion of Taxiway J at the approach end to Runway 6.
- **Outdated Building (End of Useful Life).** The current ATCT building is old and outdated (60 years old) with poor cab layout and outdated systems and equipment. In addition, the existing building has many general maintenance issues associated with a facility well past the end of its design life, including frequent roof leakages, high heating/cooling costs, and so forth (Figure 3).
- **Crossing a Movement Area to Access the Tower.** To access the current tower, one must cross Taxiway A, one of the airport's busiest taxiways, which raises safety concerns.
- **Noncompliance with ADA and Environmental Regulations.** Other significant issues presented by the current facility include lack of ADA compliance and environmental issues (presence of asbestos and lead-based paint).

Figure 3 Exterior Views of the Aging Existing ATCT

With the current level of aviation activities and projected air traffic growth at TTN, air traffic control services with a well-functioning ATCT are essential; hence, there is an urgent need for a new ATCT facility. Previous planning studies, including the airport master plan approved in 2018, also identified the need for relocating the existing tower due to the reasons described above; however, the actual siting of a new tower was left to a future ATCT siting study.

0.2.3. Anticipated Improvements

The following are the anticipated key benefits/improvements of a new ATCT at TTN:

1- Enhanced Safety and Air Traffic Efficiency

- The new ATCT, to be suitably located and with appropriate controller eye level height, will provide controllers clear LoS and unobstructed views to all movement areas and critical non-movement areas.
- Eliminating the existing operational constraints would increase controller situational awareness, reduce the risk of errors, and increase controller performance (faster processing of traffic), to name a few. These will not only

enhance safety but also increase air traffic efficiency both on the ground and in the air.

- The issue of crossing an operational/active taxiway to access the existing ATCT will be addressed. This will also bring a major improvement to airside/airfield safety.

2- Environmental-friendly and Sustainable Facility

- The new ATCT building will be an environmental- and ADA-compliant facility.
- In addition to mitigating current issues associated with asbestos and lead-based paint, the new facility will also be equipped with the most up-to-date building solutions and products geared toward energy efficiency and sustainability.

3- Improved Operational Environment Through Controller-focused Cab Design

- The new ATCT cab design will address physical and operational constraints imposed by the existing outdated cab layout.
- This will allow for a maximized focus on controller ergonomics, situational awareness, and Human Machine Interface (HMI) by adopting most-recent technologies and design practices in air traffic services.
- A controller-friendly operational environment would ultimately contribute to enhanced air traffic safety and efficiency.

1.0. PREFERRED SITES

The Airport Sponsor, supported by DY Consultants, performed preliminary site identification. Basic criteria were land availability, site accessibility, and consideration for future airport development in the area. Nine (9) candidate sites were identified. A description of all initial candidate sites considered is provided in Appendix C All Sites Evaluated.

Of the nine sites, three sites (Sites 1, 2 and 3) were identified as 'pre-sites' after passing preliminary screening, including visibility performance analyses using the Airport Traffic Control Tower Visibility Analysis Tool (ATCTVAT) as prescribed in Chapter 9, Section 3.e. of FAA Order 6480.4C. Through a detailed assessment of the sites using 3-D models and techniques, Site 1 was eliminated due to line of sight issues. Hence, Sites 2 and 3 were selected as viable sites for further assessment.

On August 10 and 11, 2021, the siting core team comprised of FAA representatives, TTN senior management, the TTN air traffic manager, and key staff of the aviation consultant met to review the pre-sites. The team subsequently evaluated the two pre-sites following the criteria described in Chapter 4, *Siting Criteria*, of draft FAA Order 6480.4C, and confirmed them as 'Preferred Sites.'

This section details the characteristics of Sites 2 and 3 per each FAA siting criteria.

1.1. AERIAL VIEW OF THE PREFERRED SITES

Figure 4 depicts the two preferred sites as well as the site of the existing ATCT on an aerial map of the airport.

Figure 4 Preferred Sites Aerial View

1.2. SITE COMPARISON CHART

Table 2 is a summary comparison of the two preferred sites.

Table 2 Site Comparison

Item Description	Site 2	Site 3
Recommended Site	2	1
Eye Level (AGL)	98	87
Eye Level (AMSL)	300	267
Cab Floor Level (AGL)	93	82
Top of Tower (AMSL)	330	297

1.3. SITE 2

1.3.1. Description

Site 2 is located in the North quadrant, behind the current East Hangar.

1.3.2. Site Reference Data

Site 2 coordinates are N40°16'59.17", W74°48'34.31". The estimated existing ground elevation is 202 ft AMSL, with a recommended controller eye level height of 98 ft AGL and a Top of Tower height of 128 ft AGL (assuming 35 ft above the cab floor level height plus antennas on the cab roof).

1.3.3. Aerial View

Figure 5 depicts the aerial view of Site 2.

Figure 5 Site 2 Aerial View

1.3.4. Tower Height Chart

Table 3 Site 2 Tower Height

Existing Ground Elevation (ft)	202
Cab Floor	
Height (ft AGL)	93
Elevation (ft AMSL)	295
Controller Eye Level	
Height (ft AGL)	98
Elevation (ft AMSL)	300
Top of Tower	
Height (ft AGL)	128
Elevation (ft AMSL)	330

1.3.5. Siting Criteria Evaluation

A. TERPS. A preliminary TERPS analysis performed by staff of FAA Eastern Service Center – ZNY District Flight Procedures (New York and New Jersey) identified **no impacts to any of the published Instrument Flight Procedures**, with a No-Effect Height (NEH) of 370 ft AMSL for this site. To account for a potential future upgrade of Runway 6-24 from CAT I to CAT II/III approach capability, a second TERPS

analysis was performed. The analysis identified **no impacts under this scenario as well**, with a NEH of 330 ft AMSL. *See Appendix J, Attachment 3*.

An airspace case (FAA Form 7460-1) with Aeronautical Study Number (ASN) 2021-AEA-1872-NRA was filed for this site. The final determination letter dated January 25, 2022 (See Appendix F) from FAA Harrisburg Airports District (ADO), shows that Site 2 has no effect on existing or planned air traffic patterns.

B. 14 CFR Part 77 Obstruction Evaluation/Airport Airspace Analysis (OE/AAA) Requirements. Analyses of Part 77 surfaces with the recommended Top of Tower elevation of 330 ft AMSL indicate that Site 2 would penetrate the transitional surface by 36.7 ft. An ATCT is considered a fundamental airport development and is typically lighted with red FAA L-810 obstruction light to allow such a penetration.

An airspace case (FAA Form 7460-1) with ASN# 2021-AEA-1872-NRA was filed for this site and the FAA provided a no objection with a condition that "the ATCT must be lighted with red obstruction in accordance with FAA Advisory Circular (AC) 70/7460-1, Obstruction Marking and Lighting, Chapters 4, 5, and 12". See **Appendix F** for the final determination letter.

C. Impacts to Communications, Navigation and Surveillance Equipment (NASWATCH). A Tech Ops Preliminary Report (TOPR) indicated that TTN ARSR is located approximately 70,000 ft SSW of Site 2, with the ARSR Radar Platform Height lower than the proposed tower height. The tower at Site 2 would have optical line of sight to TTN ARSR with a positive elevation angle. A level 3 analysis (through FAA Form7460 submittal and review) was needed. *See Appendix J, Attachment 4,* for the TOPR.

Through a further analysis conducted as part of the aeronautical study for Site 2 (ASN# 2021-AEA-1872-NRA), the FAA determined that the ATCT at the proposed site will not have effect on the existing airspace structure and projected programs of the FAA. See **Appendix F** for the final determination letter.

D. Visibility Performance Requirements. The visibility performance for Site 2 was evaluated against the criteria specified in Chapter 4, Section 4.a.-4.e. of FAA Order 6480.4C. According to these criteria, for an ATCT to be viable the location and height of the ATCT at the proposed site is expected to provide:

i. A clear LoS with a minimum angle of incidence equal to or greater than 0.80 degrees.

ii. Unobstructed views to the movement areas and critical non-movement areas.

iii. Object discrimination meeting the minimum detection thresholds (95.5%). This is the ability of the controller to notice the presence of an object on the airport surface.

iv. Two-point lateral discrimination, ensuring that the controller's viewing angle from the ATCT at the proposed site would allow for sufficient lateral discrimination of two objects at critical points of the airport surface. A minimum of 0.13 degree (8 minutes) is recommended.

The site was first evaluated using the FAA ATCTVAT tool. At the existing ground elevation of 202 ft AMSL and the recommended controller eye level height of 98 ft AGL, the site was found **to provide the minimum LoS angle of incidence of 0.8°** to all airport movement areas (runways and taxiways) and critical non-movement areas. *See Appendix H* for ATCVAT results.

Using the FAA 3-D model, Site 2 was found to provide unobstructed views to airborne traffic patterns and all movement areas except to a small portion of Taxiway H blocked by the Signature Flight Support hangar. Through further discussions and analyses, the siting team determined that the controller could see aircraft on the taxiway behind the building and coming from the hangar, and that this issue could be mitigated by controller movement within the cab. The TTN air traffic manager indicated that controls exist to mitigate such scenarios and that controller movement within the cab was a viable option. Accordingly, it was concluded that the blockage would not be a significant problem. *See Appendix D* for panoramic views from 3-D model.

Object discrimination was evaluated for three criteria: probability of detection, probability of recognition, and probability of identification. Following the values indicated in FAA Order 6480.4C and predefined in the ATCTVAT tool, the passing thresholds are set at 95.5% for detection, 11.5% for recognition, and 0.91% for identification.

A **two-point lateral discrimination** analysis was also performed for all runway ends. The minimum angle was measured to be 40 degrees between the Rwy 6 and Rwy 34 ends, **exceeding the minimum requirement of 0.13 degree (8 minutes)**.

Site 2 passed the visibility performance criteria for all airport movement areas and critical non-movement areas.

E. Safety Assessment. A Safety Risk Management Panel (SRMP) led by the FAA ATO SMS Specialist was conducted on August 11, 2021, to assess any potential safety hazards and the associated risks that an ATCT at Site 2 could have on air traffic and

the airspace. The SRMP **did not identify any significant hazard** that could jeopardize the operations of a tower at Site 2.

The SRMP did not consider the (visual) obstruction to non-movement areas by the Signature hangar as a major safety issue. However, the SRMP did note that the existing airport beacon could shine into the proposed tower cab, but this would be mitigated in the design of the proposed ATCT. *See Appendix J* for SRM report.

F. Operational Requirements. A 3-D interactive model was created for the ATCT cab. This model was inserted at Site 2 to evaluate various operational requirements as specified in FAA Order 6840.4C, Chapter 4, Section 6. To perform these assessments, the local air traffic manager donned a virtual reality (VR) headset showing the 3-D model from inside the tower cab, while the rest of the participants observed the assessment via a high-definition large screen.

Cab Orientation

The primary cab orientation to runways is towards the southwest.

Weather

The FAA 3-D model, configured with the TTN weather history, was used to evaluate any impacts that various weather conditions (fog, snow, sun glare, etc.) could have on ATCT operations at Site 2. The siting team **identified no weather-related impacts** to visibility from the ATCT cab.

Look-up/-down/-across Performance

Look-up, look-down and look-across performance was evaluated during the siting meeting using 3-D simulation. The controller donning the VR headset of the 3-D model **did not identify any issues** at the different controller positions in the cab.

Cab Mullion/Column Orientation

An 8-sided cab was considered. Both mullion and column locations were reviewed using the FAA 3-D model. An 8-mullion configuration **did not generate any blind spots** to the movement areas. Similarly, the cab configuration using four rectangular columns **did not present any visual issues**.

While both mullions and columns did not present any issues, the local air traffic manager expressed a preference for columns.

Cab Console Configuration

Traditional and slatwall console configurations were evaluated. Both configurations **created no impacts to visibility** from the cab. The local air traffic manager expressed a preference for the slatwall configuration.

Construction

The construction of a new tower at Site 2 will not impact visibility from the existing ATCT cab. When operating from the new ATCT, the existing tower might create a LoS obstruction to Twy A, which can be mitigated by the controller moving within the cab. This will be temporary as the existing tower is expected to be demolished once the new tower is operational.

Access

Access to Site 2 would be via Sam Weinroth Road. The area experiences traffic related to Signature Flight Support (FBO) activities, but **no major high-traffic volumes that would impact access by the controllers**. No flash floods, snow, landslides, falling rocks, or other hazards that would impact access to Site 2 were identified.

Cab Size Evaluation

An ATCT at Site 2 was evaluated using a 440-sq-ft cab layout, accommodating three controller positions: Local Control, Ground Control, and Controller-in-Charge. **No space-related issues were identified** during the siting exercise, and the modeled cab layout was deemed appropriate by the local air traffic manager.

G. Economic Considerations. A preliminary cost estimate was developed for Site 2. The estimate took into consideration the proposed tower height, available land for construction, utilities and cabling requirements, site access development, security (to comply with the requirements of FAA Order 1600.69C related to Facility Security (FSL) 1A for Sponsor-owned FCTs), and environmental mitigations. The **cost of construction** of an ATCT at this site is estimated to be **$12,073,750.** The details of this cost estimate can be found in *Appendix B*.

H. Environmental. Preliminary environmental impact screening conducted for this site did not indicate any potential for significant impacts.

I. Cab Size. Site 2 was evaluated using a 440-sq-ft cab layout, accommodating three controller positions. No space-related issues were identified during the siting exercise, and the modeled cab layout was deemed appropriate by the local air traffic manager.

1.4. SITE 3

1.4.1. Description

Site 3 is located in the airport's East quadrant, about 200 ft NNW of the existing Air National Guard complex.

1.4.2. Site Reference Data

Site 3 coordinates are N40°16'34.31", W74°48'29.25". The existing ground elevation at the site is 180 ft AMSL. The recommended Top of Tower height is 117 ft AGL, and the recommended controller eye level height is 87 ft AGL.

1.4.3. Aerial View

An aerial view of Site 3 is depicted in Figure 6.

Figure 6 Site 3 Aerial View

1.4.4. Tower Height Chart

Table 4 Site 3 Tower Height

Existing Ground Elevation	180
Cab Floor	
Height (ft AGL)	82
Elevation (ft AMSL)	262
Controller Eye Level	
Height (ft AGL)	87
Elevation (ft AMSL)	267
Top of Tower	
Height (ft AGL)	117
Elevation (ft AMSL)	297

1.4.5. Siting Criteria Evaluation

A. TERPS. A preliminary TERPS analysis performed by staff of FAA Eastern Service Center – ZNY District Flight Procedures (New York and New Jersey) identified **no impacts to any of the published Instrument Flight Procedures**, with a No-Effect Height (NEH) of 360 ft AMSL. To account for a potential future upgrade of Runway 6-24 from CAT I to CAT II/III approach capability, a second TERPS analysis was performed. The analysis identified **no impact under this scenario as well**, with a NEH of 300 ft AMSL. *See Appendix J, Attachment 3.*

An airspace case (FAA Form 7460-1) with Aeronautical Study Number (ASN) 2021-AEA-1873-NRA was filed for this site. The final determination letter dated January 25, 2022 (See Appendix F) from FAA Harrisburg Airports District (ADO), shows that Site 2 has no effect on existing or planned air traffic patterns.

B. 14 CFR Part 77 Obstruction Evaluation/Airport Airspace Analysis (OE/AAA) Requirements. The analysis of Part 77 surfaces with the current recommended Top of Tower elevation of 330 ft AMSL reveals that the proposed tower penetrates the transitional surface by 36.7 ft. An ATCT is considered a fundamental airport development and is typically lighted with a red FAA L-810 obstruction light to allow such a penetration.

An airspace case (FAA Form 7460-1) with ASN# 2021-AEA-1873-NRA was filed for Site 3 and the FAA provided a no objection with a condition that "the ATCT must be lighted with red obstruction light in accordance with FAA Advisory Circular (AC) 70/7460-1, Obstruction Marking and Lighting, Chapters 4, 5, and 12". *See* ***Appendix F*** for the final determination letter.

C. Impacts to Communications, Navigation and Surveillance Equipment (NASWATCH). A Tech Ops Preliminary Report (TOPR) indicated that TTN ARSR is located approximately 70,000 ft SSW of Site 3, with the ARSR Radar Platform height lower than the proposed tower height. The tower at Site 3 would have optical line of sight to TTN ARSR with a positive elevation angle. A Level 3 analysis (through 7460 case submittal and review) was needed to confirm no impacts to ASR and other NAVAIDs. *See Appendix J, Attachment 4,* for the TOPR.

Through a further analysis conducted as part of the aeronautical study for Site 2 (ASN# 2021-AEA-1873-NRA), the FAA determined that the ATCT at the proposed site will not have effect on the existing airspace structure and projected programs of the FAA. See *Appendix F* for the final determination letter.

D. Visibility Performance Requirements. The visibility performance for Site 3 was evaluated against the criteria specified in Chapter 4, Sections 4.a.-4.e. of FAA Order 6480.4C. For a tower to be viable, the location and height of the ATCT at the proposed site is expected to provide:

i. A clear LoS with a minimum angle of incidence equal to or greater than 0.80 degrees.

ii. Unobstructed views to the movement areas and critical non-movement areas.

iii. Object discrimination meeting the minimum detection thresholds (95.5%). This is the ability of the controller to notice the presence of an object on the airport surface.

iv. Two-point lateral discrimination, ensuring that the controller's viewing angle from the ATCT at the proposed site would allow for sufficient lateral discrimination of two objects at critical points of the airport surface. A minimum of 0.13 degrees (8 minutes) is recommended.

The site was first evaluated using the FAA ATCTVAT tool. At the existing ground elevation of 180 ft AMSL and the recommended controller eye level height of 87 ft AGL, the site was found **to provide the minimum LoS angle of incidence of 0.8°** to all airport movement areas (runways and taxiways) and critical non-movement areas. *See Appendix H* for ATCVAT results.

Using the FAA 3-D model and Virtual Reality technology, the core siting team found the proposed tower to provide unobstructed view to airborne traffic patterns and all the movement and critical non-movement areas. *See Appendix D* for panoramic views from 3-D model.

Object discrimination was evaluated for three criteria: probability of detection, probability of recognition, and probability of identification. Following the values indicated by the FAA Draft Order 6480.4C and predefined in the ATCTVAT tool, the passing thresholds for the are set at 95.5% for detection, 11.5% for recognition, and 0.91% for identification.

Two-Point Lateral Discrimination analyses were also performed for all runway ends. The minimum angle was measured to be at 56° between Runway 6 and Runway 34 ends, **exceeding the minimum requirement of 0.13 degree (8 minutes)**.

Site 3 passed the visibility performance criteria for all airport movement areas and critical non-movement areas.

E. Safety Assessment. A Safety Risk Management Panel (SRMP) led by the FAA ATO SMS Specialist, was conducted on August 11, 2021, to assess any potential safety hazards and the associated risks that an ATCT at Site 3 could have on air traffic and the airspace. The SRMP did not identify any risk or hazard that an ATCT at Site 3 could introduce into the national airspace system.
The SRMP noted that the existing airport beacon could shine into the proposed tower cab. Accordingly, as mitigation, the beacon will be shielded prior to the opening of the new ATCT or displaced to the top of the new tower. *See Appendix J* for the SRM report.

F. Operational Requirements. A 3-D interactive model was created for the ATCT cab. This model was inserted at Site 3 to evaluate various operational requirements as specified in FAA Order 6840.4C, Chapter 4, Section 6. To perform these assessments, the local air traffic manager donned a VR headset showing the 3-D model from inside the tower cab, while the rest of the participants observed the assessment via a high-definition large screen.

Cab Orientation

The primary cab orientation (operational view to existing runways) is towards the northwest.

Weather

The FAA 3-D model, configured with the TTN weather history, was used to evaluate any impacts that various weather conditions (fog, snow, sun glare, etc.) could have on the ATCT operations at Site 3. The siting team **identified no weather-related impacts** to visibility from the ATCT cab.

Look-up/-down/-across Performance

Look-up, look-down and look-across performance was evaluated during the siting meeting using 3-D simulation. The controller donning the VR headset of the 3-D model **did not identify any issues** at the different controller positions in the cab.

Cab Mullion/Column Orientation

An 8-sided cab was considered. Both mullion and column locations were reviewed using an interactive 3-D model created for the cab. A configuration with 8 mullions **did not generate any blind spots** to the movement areas. Similarly, a cab configuration using four rectangular columns **did not present any visual issues**.

In the initial cab orientation and column placement, one column was found to generate a blind spot to the Runway 16 end. To mitigate this, the cab was rotated 5 degrees clockwise which allowed a clear LoS to all movement areas.

Cab Console Configuration

Traditional and slatwall console configurations were evaluated. Both configurations **created no impacts to visibility** from the ATCT cab. The local air traffic manager expressed a preference for the slatwall configuration for this site.

Construction

The construction of a new tower at Site 3 will not impact visibility from the existing ATCT cab. When operating from the new ATCT, the existing tower might create a LoS obstruction to Twy A, which can be mitigated by the controller moving within the cab. This will be temporary as the existing tower is expected to be demolished once the new tower is operational.

Access

Access to Site 3 will be via Upper Ferry Road using the access to the existing Air National Guard hangar and complex. A new road, approximately 900 ft long, will be developed from the existing ANG parking lot to the site. The area has very low traffic. **No major high-traffic volumes, flash floods, snow, landslides, falling rocks, or other hazards that would impact access to the ATCT were identified.**

Cab Size Evaluation

An ATCT at Site 3 was evaluated using a 440-sq-ft cab layout, accommodating three controller positions. **No space-related issues were identified** during the siting exercise, and the modeled cab layout was deemed appropriate by the local air traffic manager.

G. Economic Considerations. A preliminary cost estimate was developed for Site 3. The estimate took into consideration the proposed tower height, utilities and cabling requirements, site access development, security (to comply with the requirements of FAA Order 1600.69C related to Facility Security (FSL) 1A for Sponsor-owned FCTs), and environmental mitigations. The **cost of construction** of an ATCT at Site 3 is estimated at **$11,481,250**. The details of this cost estimate can be found in Appendix B.

H. Environmental. Preliminary environmental impact screening conducted for this site did not indicate any potential for significant impacts. The review is presented in Appendix G.

I. Cab Size. Site 3 was evaluated using a 440-sq-ft cab layout, accommodating three controller positions. **No space-related issues were identified** during the siting exercise, and the modeled cab layout was deemed appropriate by the local air traffic manager.

2.0. FINAL SITE RECOMMENDATION

Based on the analyses performed for Sites 2 and 3 and the siting core team assessments, **Site 3** was selected as the most suitable and designated as the "**recommended site**" for a new ATCT at TTN.

While both sites meet the siting criteria specified in Chapter 4 of FAA Order 6480.4C, and particularly:

- Did not present any adverse impacts on TERPS and other airspace protection surfaces;
- Comply with minimum human factor visibility performance;
- Present no impacts on NAVAIDs; and
- Will not create obstructions during construction;

Site 3 was identified to have multiple additional advantages making it the more favorable option. Consider the following:

- From a visibility performance standpoint, Site 3 provides unobstructed views to the entire airport surface, while Site 2 suffers from a LoS obstruction to the Signature Flight Support ramp.
- Site 3 is located in an area that is less subject to vehicular traffic than Site 2, which will allow convenient access for controllers.
- The Site 3 cab orientation will be to the northwest, which is preferred when compared to the southern orientation of Site 2.

- The recommended tower height for Site 3 is lower than that of Site 2, making it the most economical option.

For the cab, columns were preferred over mullions while slatwall consoles were preferred over traditional consoles. It should be noted, however, that mullions and traditional consoles were also assessed and presented no issues.

3.0. CAB SIZE AND ORIENTATION

An 8-sided. 440-sq-ft cab with a northwest orientation was deemed adequate for the recommended Site 3. Figure 7 shows an enlarged view of the cab layout centered on the Site 3 location.

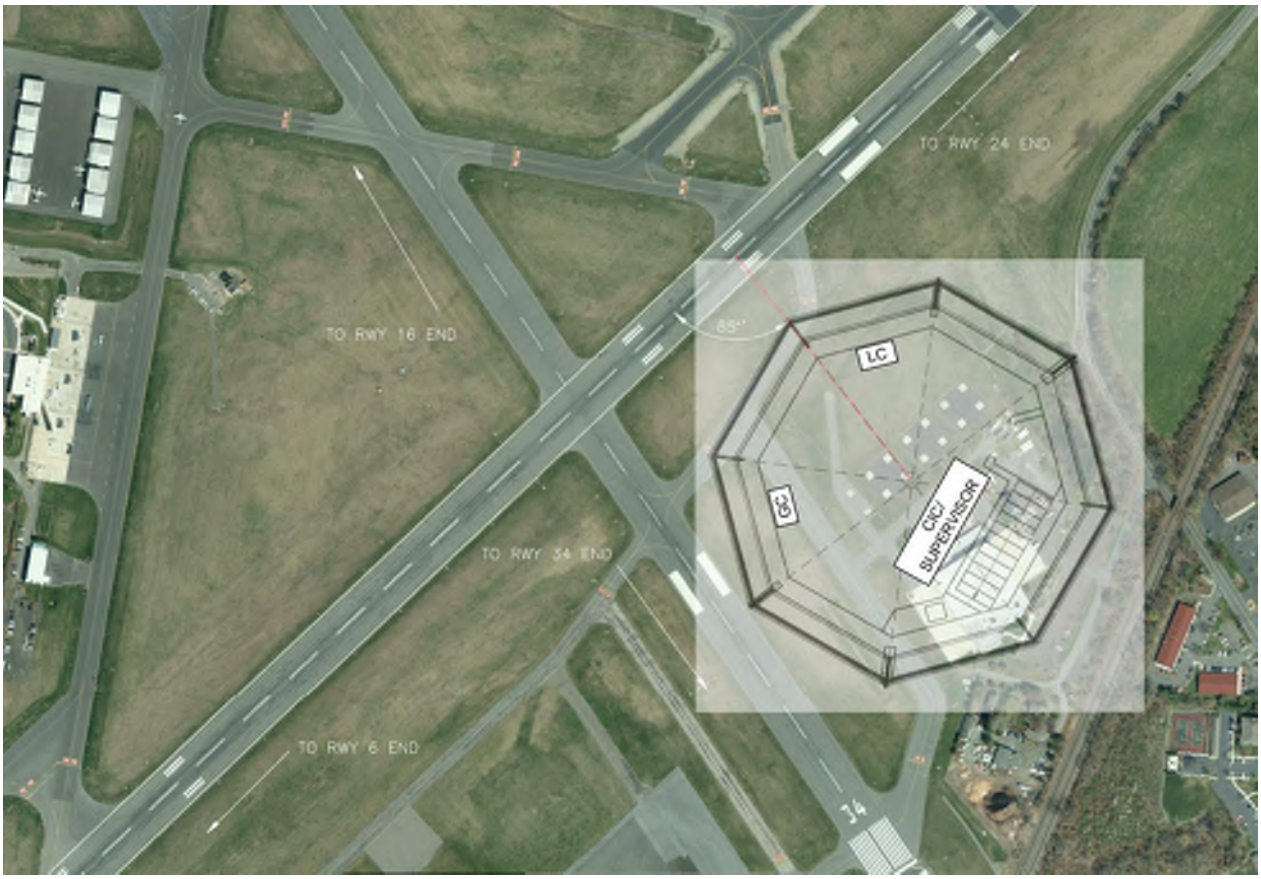

Figure 7 Site 3 Cab Orientation

Appendix K Siting Report Amendments

APPENDIX A – AIRPORT CONCURRENCE FORM

AIRPORT CONCURRENCE FORM

This form identifies the siting requirements and impacts of the new Airport Traffic Control Tower (ATCT) planned to be constructed at Trenton-Mercer Airport (TTN), Ewing, New Jersey, to replace the existing. The signed document will satisfy FAA national policy regarding written confirmation from the Airport owner/operator stating that they have advised the TTN airport user community about the new ATCT and the impacts the project would have on their operations.

Section 1. Siting Requirements

Item 1: The location of the ATCT is Site 3 (geodetic datum NAD-83)

- Latitude: N40°16'34.31"
- Longitude: W74°48'29.25"

Item 2: The ATCT height is 297' AMSL (117' AGL).

Item 3: The Air Traffic Control Specialist (ATCS) eye height used is 267' AMSL (87' AGL).

Item 4: Visibility of all movement areas and non-movement areas, look-down, -up, and -across angles, sunrise, sunset, fog, snow, rain, ramp lighting, glare, existing obstructions around the airport and other issues that can adversely affect the ATCS LOS have been considered for the ATCT location.

Section 2. Identified Impacts

(i) No hazards were identified in the Safety Risk Management Document (SRMD) prepared for this proposed action.

(ii) The FAA conducted an airspace review of the proposed structure (ASN 2021-AEA-1873-NRA). The Eastern Service Center, AJV-E24, determined that the proposed ATCT would have no impacts on Instrument Flight Rules (IFR) operations.

(iii) The proposed ATCT structure will exceed the RWY 06/24 and 16/34 Part 77 transitional surface. The ATCT will be marked and lighted in accordance with FAA Advisory Circular (AC) 70/7460-1, Obstruction Marking and Lighting, Chapters 4, 5, and 12.

Section 3. The submission of this signed document constitutes concurrence and adherence to FAA construction policy concerning appropriate public notification of the airport community regarding this intent to build a new ATCT and any impacts therein concerning the use of said airfield. The submission of this document does not waive the requirement of public comment as defined in the National Environmental Policy Act (NEPA), the Council on Environmental Quality (CEQ) regulations implementing NEPA Title 40 of the United States Code of Federal Regulations [CFR], Parts 1500–1517, and other statues, orders, directives, or policy concerning environmental assessment and alternatives.

TRENTON-MERCER AIRPORT

Proposed ATCT Relocation

Rough Order of Magnitude Construction Cost Estimate (2024)

		SITE 3	SITE 2
	ITEM DESCRIPTION	**EST. COST**	**EST. COST**
	Proposed ATCS Eye-Level Height	**87**	**98**
1	**ATCT Building and Equipment**		
1.1	ATCT BUILDING (SHAFT AND CAB)	$ 6,090,000.00	$ 6,860,000.00
1.2	ATC EQUIPMENT (INCL. FURNITURE) - 3 ATCS POSITIONS	$ 600,000.00	$ 600,000.00
	Subtotal 1 (ATCT Building & Equipment)	***$ 6,690,000.00***	***$ 7,460,000.00***
2	**Site Work**		
2.1	ACCESS ROAD	$ 140,000.00	$ 10,000.00
2.2	VEHICULAR PARKING LOT	$ 120,000.00	$ 120,000.00
2.3	SECURITY FENCE AND GATE	$ 50,000.00	$ 100,000.00
2.4	DRAINAGE	$ 200,000.00	$ 200,000.00
2.5	OTHER SITE WORK (CLEARING, PAVEMENT REMOVAL, ETC.)	$ 100,000.00	$ 150,000.00
	Sub-total 2 (Site Work)	***$ 610,000.00***	***$ 580,000.00***
3	**Utilities (incl. Trenching)**		
3.1	ELECTRICAL VAULT ROOM MODIFICATIONS	$ 120,000.00	$ 120,000.00
3.2	CONCRETE ENCASED DUCTBANK FOR AIRFIELD LIGHTING CONNECTION (4-4")	$ 576,000.00	$ 486,000.00
3.3	CONCRETE ENCASED DUCTBANK FOR NAVAIDS (4-4")	$ 576,000.00	$ 486,000.00
3.4	CONCRETE ENCASED DUCTBANK FOR GROUND TO AIR COMMUNICATION ANTENNA RELOCATION (8-4")	$ 288,000.00	$ 252,000.00
3.5	WATER LINE	$ 150,000.00	$ 150,000.00
3.6	SANITARY SEWER LINE	$ 100,000.00	$ 50,000.00
3.7	GAS LINE	$ 75,000.00	$ 75,000.00
	Sub-total 3 (Utilities)	***$ 1,885,000.00***	***$ 1,619,000.00***
	CONSTRUCTION SUBTOTAL	$ 9,185,000.00	$ 9,659,000.00
	MISCELLANEOUS ITEMS & CONTINGENCY (25%)	$ 2,296,250.00	$ 2,414,750.00
	CONSTRUCTION TOTAL	**$ 11,481,250.00**	**$ 12,073,750.00**

NOTE:

*THE ESTIMATED COST IS FOR SITE COMPARISON PURPOSES AND DOES NOT INCLUDE PROFESSIONAL SERVICES (DESIGN AND CONSTRUCTION SUPPORT/MANAGEMENT).

APPENDIX C – ALL SITES EVALUATED

Nine (9) candidate sites were identified, based on land availability and known environmental constraints (e.g., wetlands): two sites in the North quadrant, two sites in the East quadrant, two sites in the South quadrant, and three sites in the West quadrant.

Figure C-1 Candidate Sites

Initial Candidate Sites

All candidate sites were evaluated based on the following criteria:

- Land availability
- Site accessibility
- Interference with other future developments around the site
- Visibility performance
- Presence of potential LoS obstructions
- Minimum required tower height (determined based on the two previous criteria)

After an initial assessment and consultations with the TTN airport manager and the local air traffic manager, it was agreed that Sites 1, 2 and 3 would be selected as preferred sites. During the 3-D model validation meeting, the entire siting team identified Site 1 as non-viable, and subsequent 3-D model simulations were only conducted for Sites 2 and 3. More information on each site can be found in the section below.

Site 1

Site 1 coordinates are N40°16'52.77", W74°49'15.06", with an estimated current ground elevation of 206 ft AMSL. The site is located on undeveloped land behind the Merck hangar. This site provides good visibility performance to all parts of the airport surface, is easily accessible via Sam Weinroth Road, and is not located in an area that will restrict future airport development. The preliminary TERPS analysis identified that the protection of a future CAT II/III upgrade of Rwy 6-24 induces a maximal No Effect Top of Tower height for Site 1 of 360 ft AMSL (154 ft AGL), resulting in a maximum allowable Controller Eye Level height for this site of 124 ft. Tests performed during the 3-D model validation meeting highlighted that, at this eye level, LoS to a significant portion of Twy A would be obstructed by the corporate aviation hangars. The current and future terminal would also obstruct LoS to Twy A and to the majority of the terminal apron. Because of these critical LoS obstructions, Site 1 was deemed non-viable and was not analyzed further during the siting meeting.

Site 2

Site 2 coordinates are N40°16'59.17", W74°48'34.31", with an estimated current ground elevation of 202 ft AMSL. The site is located in the airport's North quadrant, behind the current East Hangar. Site 2 is located in an area where road access is already present and does not restrict future airport development. Still, some security and road congestion concerns have been raised for this site regarding its proximity to the terminal area. Site 2 has been identified as one the sites providing the clearest view of the key airport areas while not requiring a non-acceptable tower height to clear LoS obstructions. However, at

the No Effect Top of Tower height of 330 ft AMSL (98 ft AGL Controller Eye Level height), LoS to parts of the Signature Flight Support ramp, Twy A and Twy J are obstructed.

Site 3

Site 3 coordinates are N40°16'34.31", W74°48'29.25", with an estimated current ground elevation of 180 ft AMSL. The site is located about 200 ft NNW of the existing Air National Guard complex. Site 3 provides an unobstructed view of the entire airfield and requires an 87 ft AGL Controller Eye Level height (117 ft AGL Top of Tower height) to ensure minimum visibility performance requirements are met. Site 3 does not raise security or land use issues. As the area will be entirely redeveloped after the demolition of the existing Air National Guard building, road access and parking will have to be redeveloped for this site.

Site 4

Site 4 coordinates are N040°16'38.22", N040°16'38.22", with an estimated existing ground elevation of 185 ft AMSL. The site is located about 600 ft north of the existing Air National Guard complex. Site 4 presents the same location advantages as Site 3, but its location close to Twy F and Rwy 6-24 causes look down issues and creates TERPS impacts. Site 3 was selected over Site 4, with the latter site eliminated from further evaluation.

Site 5

Site 5 coordinates are N40°16'19.37", W74°48'45.21", with an estimated current ground elevation of 170 ft AMSL. The site is located between the Pfizer corporate hangar and a vacant Mercer County hangar. The site provides convenient road access, and a Controller Eye Level height of 105 ft AGL provides sufficient visibility performance clear view to the airfield with only minor LoS obstructions to non-key non-movement areas. However, the site is located in an area that will be leased for future FBO developments and has been eliminated from further evaluation.

Site 6

Site 6 coordinates are N40°16'10.68", W74°49'03.91", with an estimated current ground elevation of 165 ft AMSL. The site is located in an undeveloped area about 600 ft west of the East Hangar. The site suffers from LoS obstructions to runway ends and runway holding points that require the tower to be raised above 200 ft AGL, which is deemed not economically viable. The site is also located close to residential areas, and future airport development around the site might impair road access to the tower. Site 6 has been eliminated from further evaluation.

Site 7

Site 7 coordinates are N40°16'27.18'', W74°49'06.74'', with an estimated current ground elevation of 146 ft AMSL. The site is located next to the point where Twys A, B and J connect. Its proximity to the terminal and future parking structure creates LoS obstructions to Rwy 16, requiring a tower height of 173 ft to have a clear view to all runway ends from the cab. Security and road congestion issues are also identified due to the site's location near the terminal. Site 7 has been eliminated from further evaluation.

Site 8

Site 8 coordinates are N40°16'49.02'', W74°49'04.88'', with an estimated existing ground elevation of 203 ft AMSL. The site is located on undeveloped land north of the corporate aviation hangars. This site results in a major LoS obstruction to the intersection of Twys A and B, a critical intersection which controllers need to monitor closely. The site might also limit the development of the area. Site 8 has been eliminated from further evaluation.

Site 9

Site 9 coordinates are N40°16'58.50", W74°48'46.27", with an estimated current ground elevation of 205 ft AMSL. The site is located between the western Signature Flight Support hangar and Mercer County Community College Aviation School. Despite a location close to existing roads, the site lies within a highly developed area that may affect controller to access to the tower at key periods. LoS obstruction issues to Twy B and the Rwy 24 entrance taxiways have been identified and cannot be mitigated by a reasonable tower height. Site 9 has been eliminated from further evaluation.

APPENDIX D – PANORAMIC VIEWS FROM 3-D MODEL

This appendix includes panoramic views from the preferred sites (Sites 2 and 3) extracted from the 3-D model used during the siting meeting. Views are provided using both the traditional and slatwall configurations, with all views using the 4-column configuration.

RE: *(See attached Table 1 for referenced case(s))*
FINAL DETERMINATION

Table 1 - Letter Referenced Case(s)

ASN	Prior ASN	Location	Latitude (NAD83)	Longitude (NAD83)	AGL (Feet)	AMSL (Feet)
2021-AEA-1873-NRA		TRENTON,NJ	40-16-34.31N	74-48-29.25W	117	297

Description: 1) This notice is filed in relation to "Preferred Site 3" for the proposed new Air Traffic Control Tower (ATCT) at TTN airport. This ATCT Siting was developed following the FAA Order 6480.4B & Draft 6480.4C. 2) TechOps and ZNY District Flight Procedures (NY and NJ) have reviewed this site and validated it. 3) The coordinates provided under Structure Details section are for the center of the ATCT. 4) Below are coordinates for four corners of the proposed ATCT: - CORNER 1: 40Ã#Â°16'34.39"N, 74Ã#Â°48'29.45"W - CORNER 2: 40Ã#Â°16'34.47"N, 74Ã#Â°48'29.14"W - CORNER 3: 40Ã#Â°16'34.22"N, 74Ã#Â°48'29.04"W - CORNER 4: 40Ã#Â°16'34.14"N, 74Ã#Â°48'29.36"W 5) The attached pdf depicts the site on an aerial map.

We do not object with conditions to the construction described in this proposal provided:

You comply with the requirements set forth in FAA Advisory Circular 150/5370-2, "Operational Safety on Airports During Construction."

This proposed Air Traffic Control Tower (ATCT) will exceed the RWY 06/24 and 16/34 Part 77 Transitional surface. This proposed ATCT must be lighted with red obstruction lights in accordance with FAA Advisory Circular 70/7460-1, Obstruction Marking and Lighting, Chapters 4, 5, and 12. Copy of the current AC 70/7460-1 can be viewed and/or downloaded at https://www.faa.gov/regulations_policies/advisory_circulars/index.cfm/go/document.current/documentNumber/70_7460-1.

Ensure the proposed ATCT follows the Siting Study completed on August 10 and 11, 2021, and the maximum height including all appurtenances does not exceed the AMSL provided.

Relocate all frequencies to the proposed ATCT. The proposed ATCT also requires an antenna platform.

A separate notice to the FAA is required for any construction equipment, such as temporary cranes, whose working limits would exceed the height and lateral dimensions of your proposal.

This determination does not constitute FAA approval or disapproval of the physical development involved in the proposal. It is a determination with respect to the safe and efficient use of navigable airspace by aircraft and with respect to the safety of persons and property on the ground.

In making this determination, the FAA has considered matters such as the effects the proposal would have on existing or planned traffic patterns of neighboring airports, the effects it would have on the existing airspace structure and projected programs of the FAA, the effects it would have on the safety of persons and property on the ground, and the effects that existing or proposed manmade objects (on file with the FAA), and known natural objects within the affected area would have on the airport proposal.

When your Airport Layout Plan is updated, please include this new development. In the meantime, we will show this feature on your current ALP approved on 06/05/2018.

If you have any questions concerning this determination contact Brian Gearhart (717) 730-2833 brian.gearhart@faa.gov. On any future correspondence concerning this matter, please refer to Aeronautical Study Number 2021-AEA-1873-NRA.

APPENDIX G – ENVIRONMENTAL DOCUMENTATION

TRENTON-MERCER AIRPORT (TTN)

PROPOSED AIRPORT TRAFFIC CONTROL TOWER – SITE 3
PRELIMINARY ENVIRONMENTAL REVIEW

A. GENERAL

This document presents a preliminary environmental review of a proposed action to construct a new ATCT at the recommended Site 3 at TTN. The purpose of the review is to evaluate if the proposed action would have any significant impacts on the environment.

This review is preliminary and does not constitute a formal and complete National Environmental Policy Act (NEPA) document.

Per FAA Order 1050.1F and the associated Desk Reference, the following 16 environmental impact categories are evaluated for the proposed project site and its surroundings:

1. Air Quality
2. Biological Resources
3. Climate
4. Coastal Resources
5. Department of Transportation Act, Section 4(f)
6. Farmlands
7. Hazardous Materials, Solid Waste, and Pollution Prevention
8. Historical, Architectural, Archeological, and Cultural Resources
9. Land Use
10. Natural Resources and Energy Supply
11. Noise and Noise-Compatible Land Use
12. Socioeconomics, Environmental Justice, and Children's Environmental Health and Safety
13. Visual Effects
14. Water Resources
15. Cumulative Impacts
16. Irreversible and Irretrievable Commitment of Resources

B. POTENTIAL IMPACTS

1. Air Quality

The Air Quality Handbook Version 3 identifies criteria for pollutants to be analyzed in relation to National Ambient Air Quality Standards (NAAQS). The criteria pollutants include Nitrogen Dioxide (NO_2), Sulfur Dioxide (SO_2), Carbon Monoxide (CO), Ozone (O_3), Particulate Matter (PM-2.5), and Lead (Pb). The project is not expected to increase any pollutant emissions as it will not increase vehicular traffic (main driver of emissions at an airport). Additionally, the proposed project will not result in a change in aircraft operations.

2. Biological Resources

A list of species and other resources, such as critical habitat (collectively referred to as trust resources), that are known or expected to be on or near the preferred site was generated under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction. The following species are potentially affected by activities in this location:

- Indiana Bat
- Northern Long-eared Bat

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in the project location:

- Bald Eagle
- Blue-winged Warbler
- Red-headed Woodpecker
- Rusty Blackbird
- Wood Thrush

However, the project is located on a previously disturbed area and does not involve any disturbance of vegetation and habitats. Thus, the action would likely not jeopardize the continued existence of federally listed threatened or endangered species or result in the destruction or adverse modification of federally designated critical habitat.

3. Climate

According to the U.S. Environmental Protection Agency (USEPA) climate change indicators, greenhouse gases (GHGs) from human activities are the most significant driver of observed climate change since the mid-20th century.[1] As noted in the Air Quality section above, it is

[1] Climate Change Indicators: https://www.epa.gov/climate-indicators/greenhouse-gases#ref1

unlikely that the proposed project would increase vehicular traffic or the related pollutant and GHG emissions of the airport.

4. Coastal Resources

Coastal resources include all natural resources occurring within coastal waters and their adjacent shorelands. Coastal resources include islands, transitional and intertidal areas, salt marshes, wetlands, floodplains, estuaries, beaches, dunes, barrier islands, and coral reefs, as well as fish and wildlife and their respective habitats within these areas. As shown in Figure G-1, the airport is not located within any designated New Jersey coastal resources. As a result, this criterion can be disregarded from further analysis.

5. Department of Transportation Act, Section 4(f)

Under Section 4(f) of the U.S. Department of Transportation (USDOT) Act of 1966, projects that receive funding or approval by any USDOT agency must avoid impacts to Section 4(f) properties. These include parks and recreational areas of national, state, or local significance that are both publicly owned and open to the public; publicly owned wildlife and waterfowl refuges of national, state, or local significance that are open to the public; and historic sites of national, state, or local significance in public or private ownership, regardless of whether they are open to the public.

The project likely will not affect any Section 4(f) resources as it will not generate additional traffic and is totally contained within the airport itself.

Figure G-1 Coastal Resources at TTN

6. Farmlands

Based on a review of the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey, the project site does not contain soils classified as prime farmland soils, unique farmland soils, or soils of statewide or local importance by the NRCS. The project area consists of previously disturbed, developed and maintained grassland areas located entirely within Airport property.

In addition, the project area does not include land zoned for agricultural preservation and does not present any potential to convert important farmlands to nonagricultural uses. Important farmlands include pastureland, cropland and forest considered to be prime, unique, or statewide or locally important land. The proposed project would not affect farmlands.

7. Hazardous Materials, Solid Waste, and Pollution Prevention

The project will not involve the use of hazardous materials, nor will the project generate a significant volume of solid waste. However, minimal waste will be produced during construction. Best management practices will be enforced to avoid significant impacts.

8. Historical, Architectural, Archeological, and Cultural Resources

The National Historic Preservation Act of 1966 (NHPA), as amended, and the Archeological and Historic Preservation Act of 1974, as amended, require federal agencies to consider impacts of their actions to resources of historic, cultural or archeological significance. Section 106 of the NHPA requires consultation with the State Historic Preservation Officer (SHPO) and Tribal Historic Preservation Officer(s) (THPO) to determine potential adverse effects of a federal action to culturally significant resources and/or historic properties on or eligible for listing on the National Register of Historic Places (NRHP).

The New Jersey Department of Environmental Protection (NJDEP) GeoWeb website was reviewed for information on historic and archeological sites on or in the vicinity of the airport. GeoWeb data indicate that the project site does not fall within or nearby areas either on the state or national historic registers or eligible for listing on these registers. Additionally, based on the historical and archeological survey and reconnaissance-level historical and architectural survey conducted for various projects at TTN Airport in June 2019, it was concluded that there are no previously documented historic properties listed in or eligible for listing in the NJR or NRHP within the APE-Architecture (Figure G-2).

Figure G-2 Historic, Architectural, Archeological and Cultural Resources Properties Around TTN

9. Land Use

The proposed project is not expected to change the land use on or around the airport. The new tower is a replacement for an existing tower and will serve the same purpose and function as the existing ATCT. The project site is within airport property which is already used for transportation.

10. Natural Resources and Energy Supply

Energy requirements associated with an airport project generally fall into two categories: (1) those that relate to changed demands for stationary facilities (e.g., airfield lighting, terminal building heating), and (2) those that involve the movement of air and ground vehicles.

The design of the proposed ATCT will be in accordance with current energy standards and building codes of the State of New Jersey; FAA Order 1053.1, *Energy and Water Management Program for FAA Buildings and Facilities*; and other relevant codes and standards to ensure the highest standards of design, including the principles of sustainability. The project will not negatively affect natural resources and energy supply.

11. Noise and Noise-Compatible Land Use

The project is not expected to generate any additional noise beyond that of the existing tower. There may be short-term noise impacts associated with construction; however, best management practices will be implemented to mitigate and minimize construction noise.

12. Socioeconomics, Environmental Justice, and Children's Environmental Health and Safety

According to FAA Order 1050.1F and FAA Order 5050.4B, proposed airport development actions must be evaluated to determine if they would cause social, including effects on health and safety risks to children, and socioeconomic impacts, and assess the potential to cause disproportionate and adverse effects to low-income or minority populations.

No residential relocation, loss in community tax base, disruption of established communities, or change in land use will occur, and current parking operations and local traffic patterns would not be affected or disrupted by the proposed tower. Accordingly, no significant impacts within this environmental category are anticipated.

13. Visual Effects

Visual effects deal with the extent to which the proposed action would either:

- Produce light emissions that create annoyance or interfere with activities; or

- Contrast with, or detract from, the visual resources and/or the visual character of the existing environment.

The proposed project will not emit light to the extent that it will create visual effects on the surrounding community/properties. Given its height and location entirely within the airport property and involves replacement-related activities, the proposed tower is not expected to affect existing views to the airport from surrounding properties. No adverse visual or aesthetic impacts are anticipated.

14. Water Resources

The project will not adversely affect any federal or state delineated wetlands, flood plains, surface water features, or ground water resources. Figure G-3 and G-4 below show the wetlands arounds the preferred site.

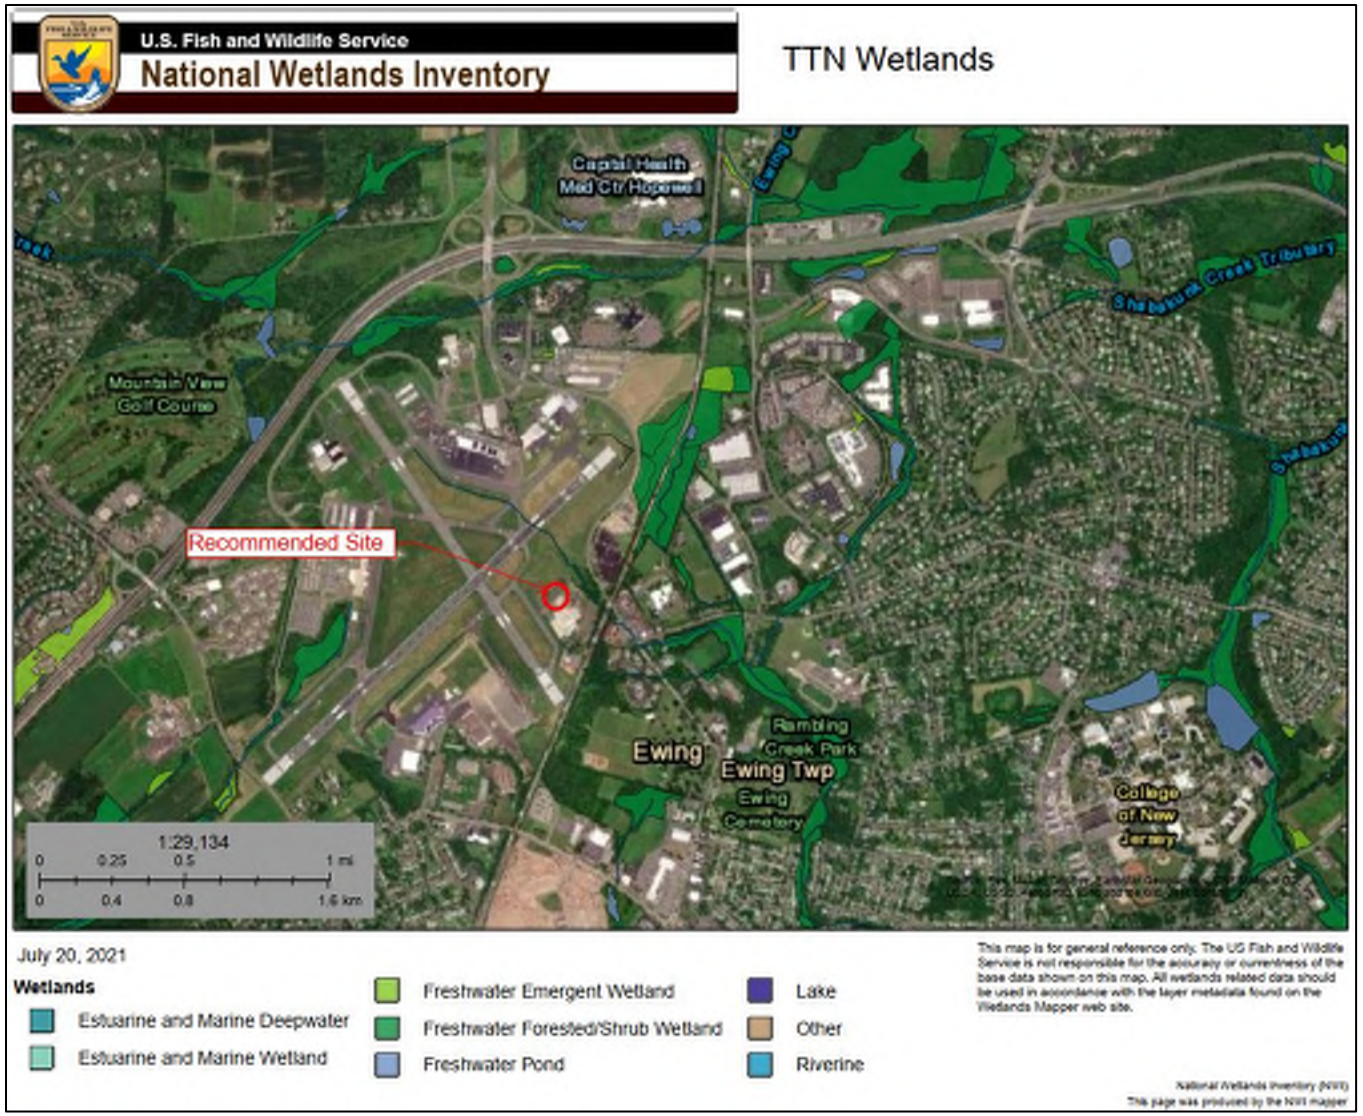

Figure G-3 Project Area Wetlands – National Wetlands Inventory

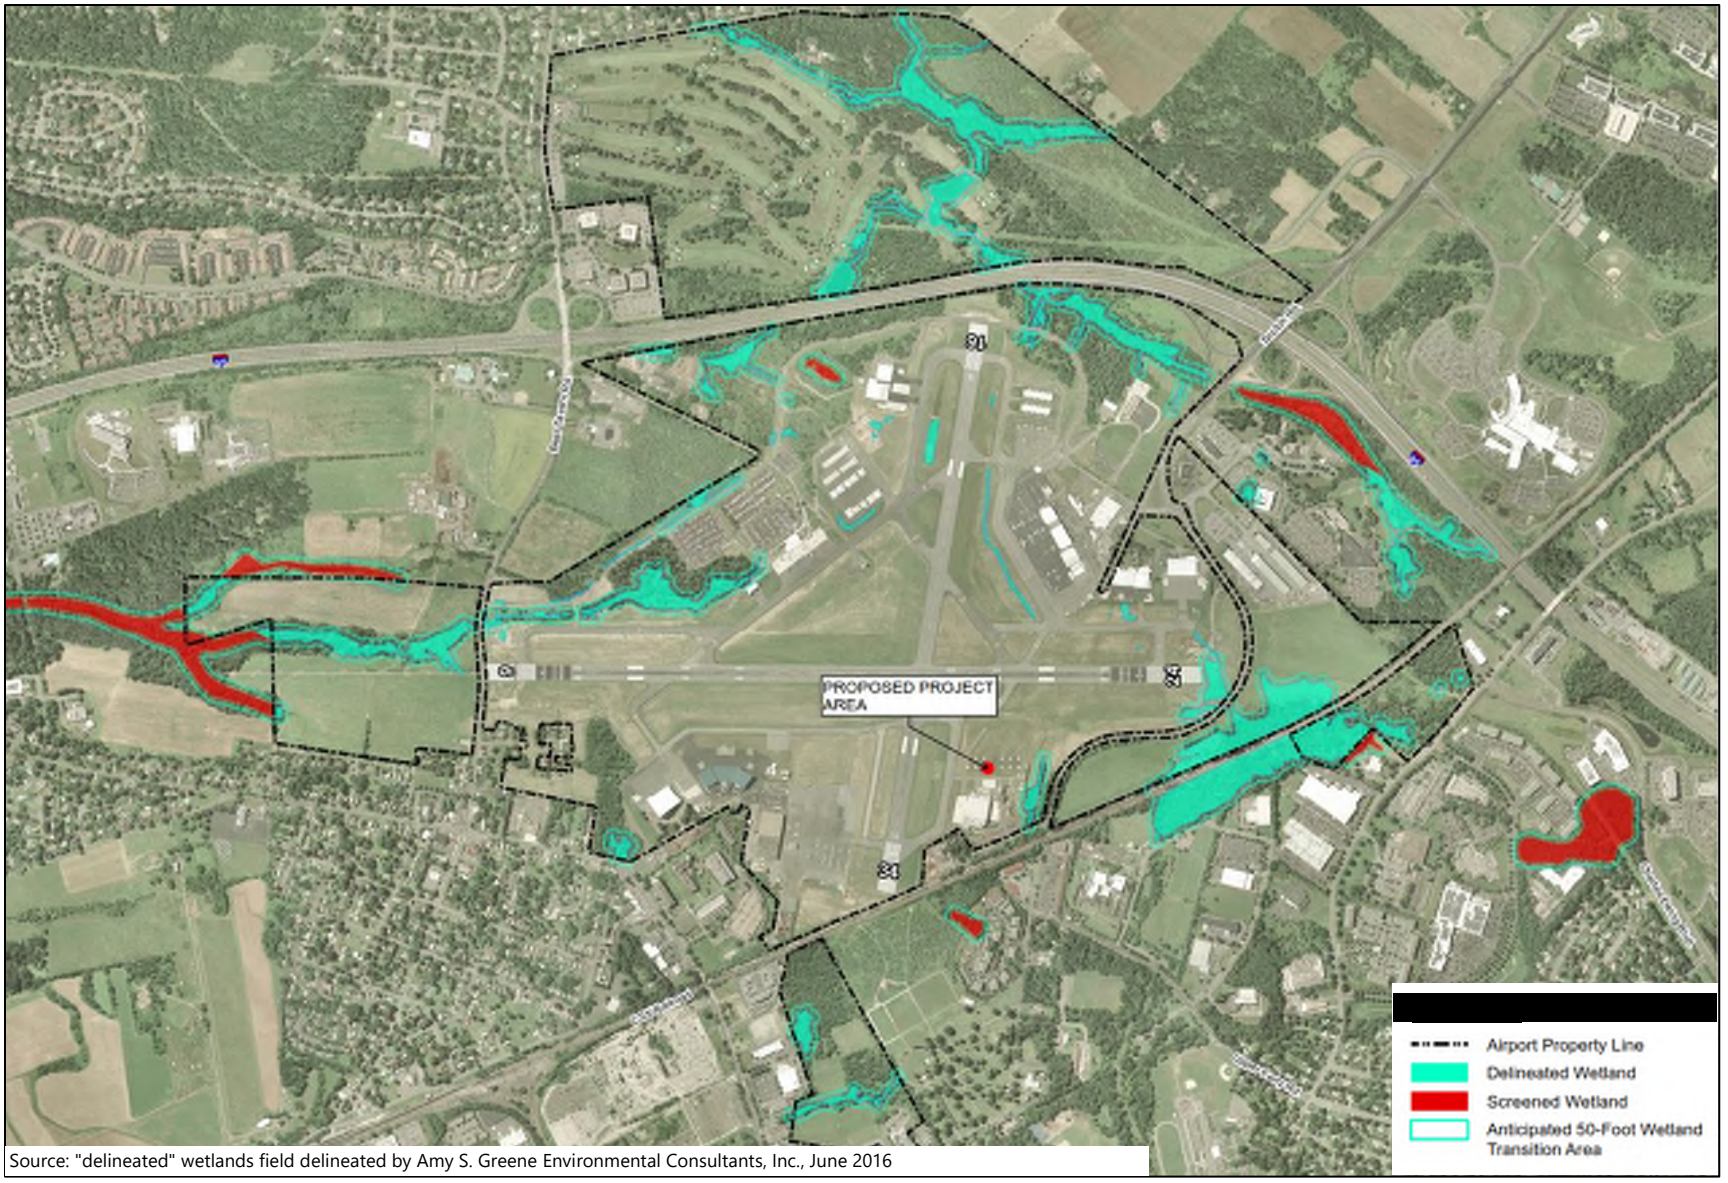

Source: "delineated" wetlands field delineated by Amy S. Greene Environmental Consultants, Inc., June 2016

Figure G-4 TTN Airport – Wetlands and Wetland Transition Areas

15. Cumulative Impacts

The total impacts of the proposed project, combined with other known past and future projects at the airport, will not cause a cumulative significant impact to environmental resources as all the projects are subject to NEPA requirements.

16. Irreversible and Irretrievable Commitment of Resources

The proposed project will not use any rare or scarce raw materials or products. No aspect of the proposed project is irreversible. Accordingly, the project will not create any significant impacts in this category.

C. SUMMARY OF PRELIMINARY OBSERVATIONS

Based on the preliminary evaluation of 16 environmental categories, the action to construct an Airport Traffic Control Tower (ATCT) at Site 3 is unlikely to cause any significant impacts to the environment.

According to FAA Order 1050.1F, Chapter 5, Section 5-6.4, Paragraph dd., "construction, reconstruction, or relocation of a non-Radar, Level 1 airport traffic control tower …." could be a categorically excluded (CATEX) action "provided the action would occur on a previously disturbed area of the airport and not: (1) cause an increase in the number of aircraft operations, a change in the time of aircraft operations, or a change in the type of aircraft operating at the airport; (2) cause a significant noise increase in noise sensitive areas; or (3) cause significant air quality impacts." (Emphasis added.) The proposed ATCT will be a VFR non-radar low activity tower (former Level 1) and the project site sits on a previously disturbed area. It will not affect aircraft operations, change the type of aircraft operating at TTN, nor cause a significant increase in noise.

Section 5-2 of FAA Order 1050.1F states that the action must not involve any extraordinary circumstances and defines extraordinary circumstances as "factors or circumstances in which a normally categorically excluded action may have a significant environmental impact that then requires further analysis in an EA or an EIS." According to the preliminary environmental review, the project is not likely to involve any of the extraordinary circumstances listed in Section 5-2. Therefore, the proposed project will likely qualify as a CATEX action.

As noted previously, this evaluation does not constitute a formal NEPA review. A formal and complete process will be concluded through consultation with relevant agencies, including the FAA Harrisburg Airport District Office, which is responsible for making CATEX determinations and approving airport projects for compliance with relevant NEPA requirements.

APPENDIX H – AIRPORT TRAFFIC CONTROL TOWER VISIBILITY ANALYSIS TOOL (ATCTVAT)

Visibility Siting Requirements Human Factors Analyses

Objective: Two human performance metrics, Object Discrimination Analysis and Object Discrimination and Line of Sight (LOS) Angle of Incidence, were used to assess the impact of tower height on air traffic control tower specialist distance perception.

Technical Approach: the tower visibility analysis tool (http://www.hf.faa.gov/visibility) was used to assess the human performance metrics[1].

Air Traffic Control Tower: **TTN SITE 2 [TO RUNWAY 16 END]**
Light Level: **Sunlight Clouds**
Ground Turbulence: **Medium**
Target Object: **Cessna 172**, target orientation: **Front View**
Observer Eye Height: **98**
Vertical Elevation Change Between Observer and Key Point (feet): **87**
Ground Elevation at Tower (MSL): **202**
Ground Elevation at Key Point (MSL): **213**
Tower to Key Point Distance: **2357** (feet) **0.72** (km)
Visibility Range: **10**(Miles) **16.09** (km)

1. Object Discrimination Analysis Results

Criteria	Threshold	Tower Results	Pass/Fail
probability(detection)	95.5%	100%	Pass
probability(recognition)	11.5%	99.9%	Pass

2. Line of Sight (LOS) Angle of Incidence

Threshold	Tower Results	Pass/Fail
0.8 degrees or 48 minutes	2.11degrees	PASS: Change in elevation between observer and key point should be no less than 33 feet.

Threshold	Tower Results	Pass/Fail
0.8 degrees or 48 minutes	5.03degrees	PASS: Change in elevation between observer and key point should be no less than 17 feet.

[1]Krebs, Hewitt, Murrill, and Driggers, 2005. *How High is High Enough? Quantifying the Impact of Air Traffic Control Tower Observation Height on Distance Perception*, International Symposium on Aviation Psychology, 1-5.

Visibility Siting Requirements Human Factors Analyses

Objective: Two human performance metrics, Object Discrimination Analysis and Object Discrimination and Line of Sight (LOS) Angle of Incidence, were used to assess the impact of tower height on air traffic control tower specialist distance perception.

Technical Approach: the tower visibility analysis tool (http://www.hf.faa.gov/visibility) was used to assess the human performance metrics[1].

Threshold	Tower Results	Pass/Fail
0.8 degrees or 48 minutes	2.29degrees	PASS: Change in elevation between observer and key point should be no less than 26 feet.

[1]Krebs, Hewitt, Murrill, and Driggers, 2005. *How High is High Enough? Quantifying the Impact of Air Traffic Control Tower Observation Height on Distance Perception*, International Symposium on Aviation Psychology, 1-5.

Visibility Siting Requirements Human Factors Analyses

Objective: Two human performance metrics, Object Discrimination Analysis and Object Discrimination and Line of Sight (LOS) Angle of Incidence, were used to assess the impact of tower height on air traffic control tower specialist distance perception.

Technical Approach: the tower visibility analysis tool (http://www.hf.faa.gov/visibility) was used to assess the human performance metrics[1].

Air Traffic Control Tower: **TTN SITE 3 TO RUNWAY 24 END**
Light Level: **Sunlight Clouds**
Ground Turbulence: **Medium**
Target Object: **Cessna 172**, target orientation: **Side View**
Observer Eye Height: **87**
Vertical Elevation Change Between Observer and Key Point (feet): **75**
Ground Elevation at Tower (MSL): **180**
Ground Elevation at Key Point (MSL): **192**
Tower to Key Point Distance: **1878** (feet) **0.57** (km)
Visibility Range: **10**(Miles) **16.09** (km)

1. Object Discrimination Analysis Results

Criteria	Threshold	Tower Results	Pass/Fail
probability(detection)	95.5%	100%	Pass
probability(recognition)	11.5%	99.9%	Pass

2. Line of Sight (LOS) Angle of Incidence

Threshold	Tower Results	Pass/Fail
0.8 degrees or 48 minutes	2.29degrees	PASS: Change in elevation between observer and key point should be no less than 26 feet.

APPENDIX I – MEETING MINUTES AND OTHER PERTINENT INFORMATION

Trenton-Mercer Regional Airport FCT

Meeting Minutes

August 10–11, 2021

Federal Aviation Administration (FAA) representatives and Trenton-Mercer Regional Airport (TTN) participated in the new Federal Contract Tower (FCT) siting activities at TTN located in Ewing Township, New Jersey and via Zoom on August 10–11, 2021. The team followed FAA Siting Order 6480.4C, which incorporates a new process for reviewing the Preferred sites; and the QCG SRM Specialist facilitated the Safety Risk Management Panel (SRMP).

Facilitator: Shari Teel

QCG SRM Specialist: Mike Natoli/Karl Howard

3-D VR Modeler: Jeff Fischer/Matt Ballon

Participants: See Attachment 1

1. Purpose of Visit

This siting activity is to verify the line of sight (LOS) from the planned site locations for a replacement ATCT.

2. Agenda

a. In Brief
b. ALP review
c. Assessment of preferred sites
d. SRMP assessment
e. Out Brief

3. Methodology

A conference room at a county building and then at the airport was set up to accommodate a 10x10 space in which the controller operated the headset. The National Coordinator (NC) facilitated the siting exercise remotely. Most of the participants observed remotely via Zoom. There Airport identified two pre-sites for assessment: Site 2 and Site 3.

4. Overview of Tower Configuration

a. 440 sf 8-sided cab

b. Slatwall configuration preferred

c. Four (4) column rectangular configuration preferred

d. Top of Tower – 35 feet above cab floor

5. Preferred Site Assessment by the Air Traffic Manager

a. Site 3

Orientation: NW

AGL: 87 ft AGL/267 ft AMSL (eye level) / 82 ft AGL/262 ft AMSL (cab floor)

Ground Level: 180 ft AMSL

Reference location: East quadrant airport between RWY 24 end and RWY 34 end

TERPS: No impacts

TOPR: No show-stoppers

Columns/Mullions: Both options were assessed, the AT Manager prefers columns.

Traditional Console/Slatwall: Both options were assessed. Both the ATM Manager and Tech Ops prefer slatwall due to better views and ease of configuration.

NOTE: Ground Control (GC) and Local Control (LC) positions were switched to allow GC a better view of TWY E. Moving the tower was not an option due to future airport plans.

Advantages:

- Good LOS of sight of all movement areas.
- Flight patterns in front of the controller.
- No TERPS issues
- No TOPR issues
- No issues identified due to weather, sunrise, sunset, snow, fog, or rain.
- Better view of the existing and future fire house.

Disadvantages:

- None.

b. Site 2

Orientation: SW

AGL: 98 ft AGL / 300 ft AMSL (eye level) / 93 ft AGL/295 ft AMSL (cab floor)

Ground Level: 160 ft AMSL

Reference location: NE quadrant of airport

TERPS: No impacts

TOPR: No show-stoppers

Columns/Mullions: Both options were assessed, the AT Manager prefers columns. The cab was rotated 5 degrees CW to move hot spot off Sector A/B column from LC position.

Traditional Console/Slatwall: Both options were assessed. Both the ATM Manager and Tech Ops prefer slatwall due to better views and ease of configuration.

Advantages:

- Good LOS of sight of all movement areas, except for a 100 yard portion of TWY H behind the Signature buildings.
- Flight patterns in front of the controller.
- No TERPS issues
- No TOPR issues
- No issues identified due to weather, sunrise, sunset, snow, fog, or rain.

Disadvantages:

- The ramp in front of the Signature buildings is blocked; however this is not a movement area. AT Manager prefers to see the ramp for improved operations.
- Trees blocking Juliet to some degree. Trees can be trimmed as agreed per airport.
- Orientation SW; the optimum view is north due to weather, etc.

6. Safety Assessment

Karl Howard provided the safety in brief in 08/10/21. The safety assessment was conducted on 08/11/21. No safety issues were identified.

6. Conclusions

The Recommended site is Site 3. The AT Manager prefers columns. The AT Manager and tech ops prefer slatwall.

Airport would like the ability to see lights at night.

7. Actions

See Attachment 7

August 11, 2021

Attachment 3 – TERPS Analysis

Here are the preliminary results for NEH considering a RWY 6 ILS CAT II/III system:

- Site 1 is outside the cat II/III eval area no change to the previous eval
- Site 2 NEH for RWY 6 ILS CAT II/III (if it were possible to upgrade the system at some future time) = 330 ft AMSL
- Site 3 NEH for RWY 6 ILS CAT II/III (if it were possible to upgrade the system at some future time) = 300 ft AMSL

Preliminary results for pre-sites with current RWY 6: Based on the data provided, there are NO IMPACTS to any currently published Instrument Flight Procedures (IFPs). I evaluated all 4 corners of all 3 sites listed (12 points total). None of those points impact any IFPs at TTN.

Attachment 4 – TOPR

Tech Ops Preliminary Report (TOPR)
For
Trenton, NJ (TTN) ATCT Facility

August 2021

Limited Content - Not for Official Use

PROPOSAL:

The proposal is for a new ATCT with several potential locations at Trenton-Mercer Regional Airport (TTN).

ANALYSIS:

The proposal was analyzed using the NASWATCH iOEAAA tool as well as performing quantitative calculations for potential impacts to aviation facilities. Please see the following disclosure:

Not intended for supplemental use outside OESG Tech Ops purview. NASWATCH is an iOEAAA tool intended for use strictly by OESG Tech Ops in OE/AAA airspace case evaluation providing conservative results – dependent on facility type and available database resources within iOEAAA. A 7460 form is still required for official submission.

RESULTS:

The following nearby facilities were identified and analyzed for potential impacts with the following results:

- **Site 2**
  - **Current TTN ATCT** – Possible shadowing of existing ATCT to Taxiway A. Coordination with ATCT personnel will be required.
  - **TTN, TTNZ RTR** – **Using the existing tower cross sectional width as a reference, no potential impacts to the RTRs are anticipated.**
  - **TTN ARSR** – **Radar platform LOS is possible with positive elevation angle; Level 3 analysis needed.**

- **Site 3**
  - **Current TTN ATCT** – Possible shadowing of existing ATCT to Taxiway A. Coordination with ATCT personnel will be required.
  - **TTN, TTNZ RTR** – **Using the existing tower cross sectional width as a reference, no potential impacts to the RTRs are anticipated.**
  - **TTN ARSR** – **Radar platform LOS is possible with positive elevation angle; Level 3 analysis needed.**
  - **TTN Runway 06 LOC (CAT I)** – **Within Small Structure Protection Zone. Level 3 analysis needed.**

Limited Content - Not for Official Use

The predicted impacts to the nearby aviation facilities are depicted in the following pictures. The potential impact is calculated using the following ATCT elevations:

- Site 2:
  - Overall Tower Height – 325 ft. AMSL
- Site 3:
  - Overall Tower Height – 297 ft. AMSL

Figure 1. Current TTN ATCT

In calculating the potential impact for the current TTN ATCT, it was found that the following movement areas would experience optical Line-of-Sight blockage:

- **Site 2, Site 3**
  - Taxiway A

To confirm that this will not adversely impact the operations of the existing ATCT, additional coordination with Air Traffic personnel would be required.

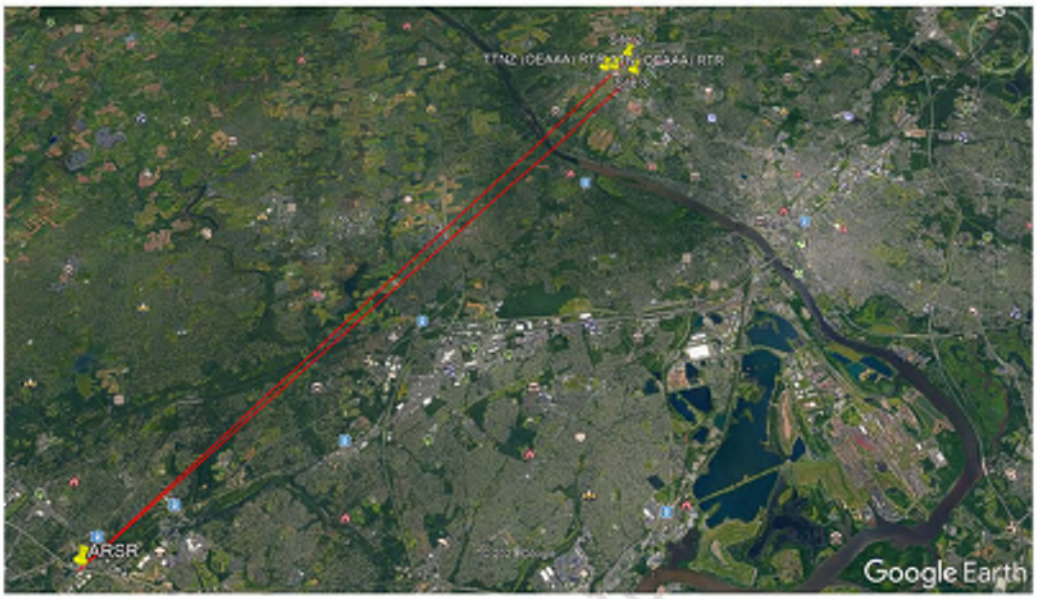

Figure 2. TTN ARSR

In calculating the potential impact for the TTN ARSR located approximately 70,000 ft. SSW of the proposed ATCT site locations at the closest point, it was found that the towers would have optical Line-of-Sight to the ARSR with a positive elevation angle since the proposed towers are higher than the ARSR Radar Platform Height. To confirm that this will not adversely impact the functionality of the ARSR, additional Level 3 analysis is needed.

Limited Content Not

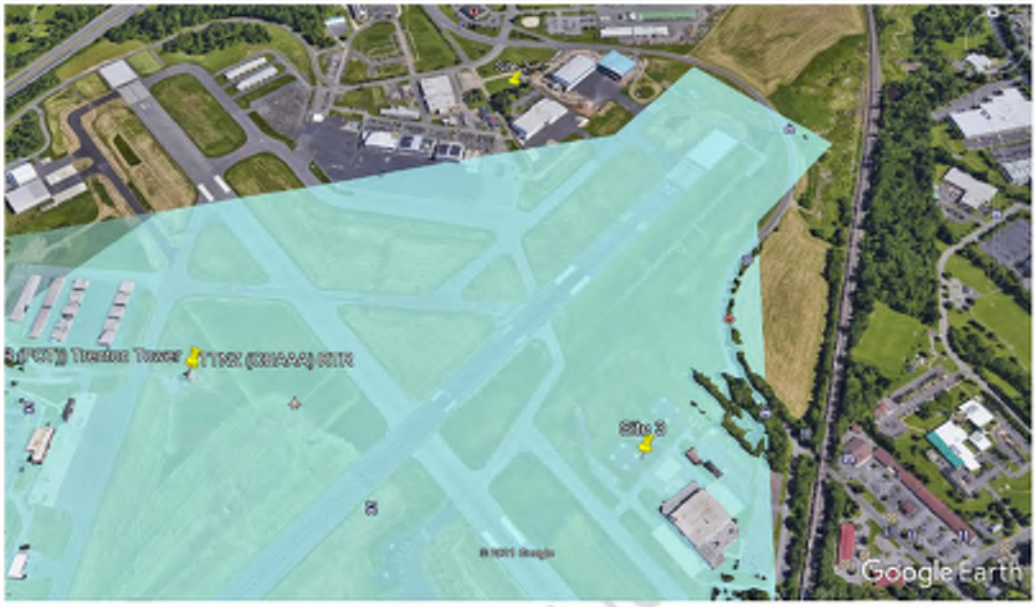

Figure 3. TTN Runway 06 LOC (CAT I)

In calculating the potential impact for the TTN Runway 06 LOC, located approximately 2500 ft. SSW of the proposed ATCT site locations at the closest point, it was found that Site 3 would be within the protection area for small structures. To confirm that this will not adversely impact the functionality of the LOC, additional Level 3 analysis is needed.

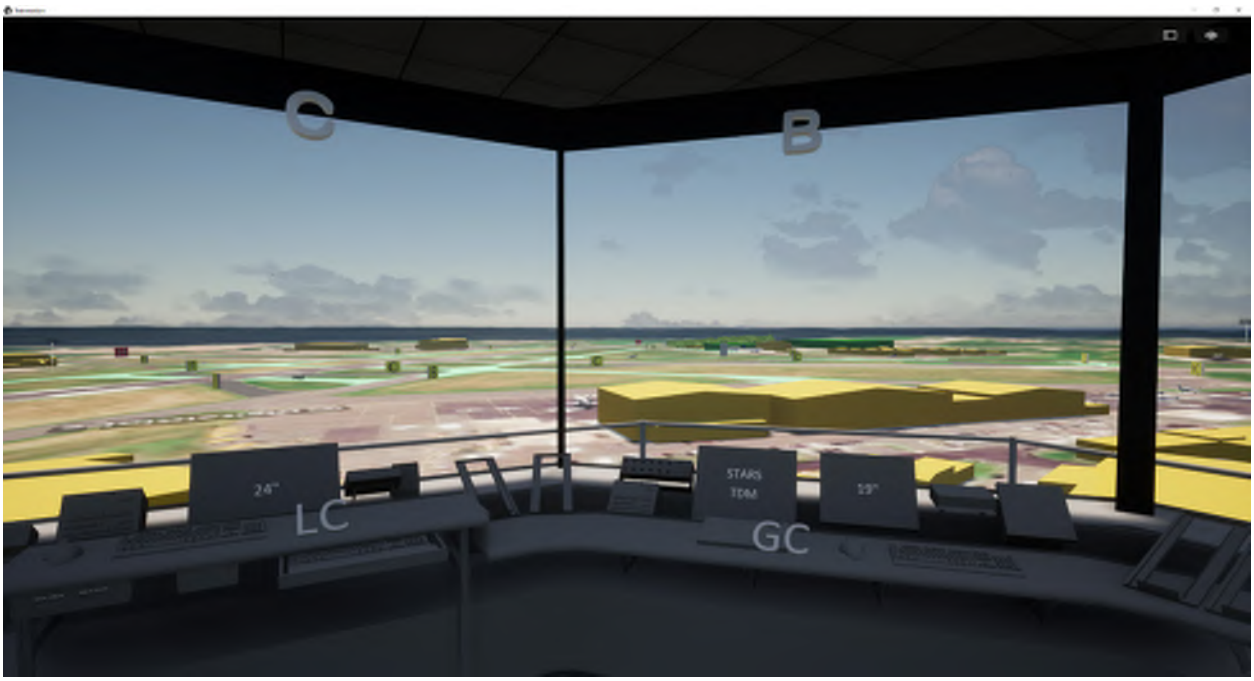
Limited Content - Not

Attachment 5 – Cab Layout

Site 3 – Columns/Slatwall – GC Position

Site 3 – Slatwall/Columns – Local Control Position

Site 3 – Traditional Consoles/Columns



Site 2 – Slatwall/Columns

Site 2 – Traditional Consoles/Columns

Attachment 6 – SRM Document

TBD

Attachment 7 – Action Items

Item	Action	POC	Telephone	Due Date	Comments
1	View Final 3-D Model and Cab Size Recommendation	3-D Modeler, Jeff Fischer	303-601-9864	10 days after the siting event	The 3-D modeler will provide the final proposed cab model, orientation and equipment, and 360° screenshots to the Airport Sponsor for each preferred site, for use in the Siting Report preparation. These items document the cab layout, cab size, column/mullion configuration, and orientation (referenced to a runway) for each preferred site.
2	Final Airspace Studies	Airport Sponsor, Melinda Montgomery	609-882-1601	Within 2 weeks of siting completion.	The Airport Sponsor must comply with the FAA OE/AAA requirements on the preferred sites (refer to the OE/AAA Web site). Include final determination letter on the preferred sites.
3	Environmental Study. The Airport Sponsor is responsible for obtaining applicable environmental approvals per Federal, state, and local requirements.	Airport Sponsor, Melinda Montgomery	609-882-1601	TBD	The Airport Sponsor is responsible for obtaining applicable environmental approvals per Federal, state, and local requirements.
4	Prepare Siting Report. The Airport Sponsor is responsible for development of the Siting Report. If the Airport Sponsor developed the model, the Airport Sponsor must include, in the Siting Report, a letter from the licensed engineer certifying the model is developed in accordance with the required accuracy (within ±18 inches vertical / ±5 feet horizontal), as well as the signature of the engineer and the appropriate seal. A template is available.	Airport Sponsor, Melinda Montgomery	609-882-1601	TBD	The initial draft and final draft Siting Report must be developed in accordance with Appendix C. The Airport Sponsor will deliver the initial and final drafts of the Siting Report to all participants. After the Airport Sponsor has resolved all comments, the Airport Sponsor will submit the final report to the FCT PPM.

Item	Action	POC	Telephone	Due Date	Comments
5	Service Area Siting Report Briefing and Approval.	PPM, John Seliga	404-305-7153	TBD	The FCT PPM will brief the Siting Report to the Service Area Director of Air Traffic Operations and Service Area Director of Technical Operations for their concurrence.
6	Headquarters Final Siting Report Briefing and Approval.	PPM, John Seliga	404-305-7153	TBD	The FCT PPM will submit the final siting report to Terminal Facilities Execution, who will brief the Siting Report to the Director of Air Traffic Control Facilities and Engineering Services for their concurrence.
7	Final Report Distribution.	National Coordinator, Shari Teel	281-507-9232	TBD	After Headquarters approval of the Siting Report, the report will be posted on the Terminal Facilities Execution DEI Siting KSN Web site at the following address: https://ksn2.faa.gov/AJW/AJW244C/dei/siting/default.aspx. An electronic copy of the Siting Report will be delivered, and the original signed report will be mailed, to the Airport Sponsor (if hard copy).
8	Design Phase: ATC Review Control Positions	Airport Sponsor, Melinda Montgomery AT Manager, Brian Murphy	609-882-1601 609-882-4422	TBD	During the Design phase, ATC should review the control positions to optimize configuration.
9	Siting Report Renewal Process. Refer to Chapter 8, Siting Report Renewal Process.	National Coordinator, Shari Teel	281-507-9232	18 months after siting report approval.	See FAA Order 6480.4
10	Add Recommended Site to ALP	Airport Sponsor, Melinda Montgomery	609-882-1601	TBD	Add the Recommended site to the ALP.

TTN Pre-Site Review and Model Demo
Meeting Minutes
07/19/21

Purpose: To demo the Trenton-Mercer Regional Airport model and pre-sites.

Participants:

Brian Murphy
Frank Boyer
Jeff Fischer
Lyor Dahan
Matt Ballon
Melinda Montgomery
Parshva Shah
Prudence Tuyishimire
Seth Young
Shari Teel

1. Verified the orientation of the existing tower and reviewed the model. The team identified the following changes that need to be incorporated into the model:

    a. Add the fire building near Site 3.

    b. Add the grove of trees between Site 1 and RWY 6 end.

    c. Add helicopter scenarios as provided by ATC.

2. Site 1 – As noted by Melinda Montgomery, Site 1 only works if area around TWY J is never developed. There are many line-of-sight (LOS) issues with Site 1. Will need to see if raising the tower will improve LOS. The Site 1 no effect height (NEH) (360 ft AMSL) would not be affected if RWY 6 were to be upgraded to CAT II/III.

3. Site 2 – Raised to 63 ft AGL cab floor for validation meeting on 07/29/21. Brian Murphy to provide helicopter scenarios for addition to model. If the plan is to upgrade RWY 6 to CAT II/CAT III, then Site 2 NEH is 330 ft AMSL.

4. Site 3 – Site 3 has the best overall view of airport and LOS. If the plan is to upgrade RWY 6 to CAT II/CAT III, then Site 3 NEH is 300 ft AMSL.

5. Model Validation is scheduled for 7/29/21. The 3-D equipment will be shipped to TTN on 7/22/21, with a 7/23/21 arrival. The 3-D equipment will be set up in M. Montgomery's office.

6. The siting is scheduled for 8/10–11/21. Special guests should plan to attend the siting 8/10/21 at 10 a.m. or 1 p.m.

TTN Model Verification Telecon
Meeting Minutes
07/29/21

Purpose: To validate the Trenton-Mercer Regional Airport model for the TTN Siting activity on August 10–11, 2021.

Participants:

Brian Murphy
Eric Billowitz
Frank Boyer
Jeff Fischer
Lyor Dahan
Matt Ballon
Melinda Montgomery
Pierre Bougeard
Prudence Tuyishimire
Seth Young
Shari Teel

1. The National Coordinator (NC/Shari Teel) reviewed the agenda. The NC informed the participants that the FAA siting team will not be traveling to TTN to conduct the siting due to anticipated FAA travel guidance due to COVID.

2. Site Data

   - 440, 8-sided cab
   - 15 degree glass
   - Slatwall and traditional control position configuration
   - Columns and mullions

2. Model Validation – The model was validated from the existing ATCT. The model was determined to be accurate. A validation letter will be sent to the airport and ATM for signature

3. Site Assessment

   b. Site 1

      1) Orientation – SE

      2) Tower Height – Site 1 was initially reviewed at 92 feet AGL cab floor. Site 1 was then raised to 119 ft AGL cab floor.

      3) Stairs – The stairs are in the correct location.

      4) Columns/Mullions – Mullions were shown

      5) Obstructions – The new terminal parking structure and trees behind the parking structure provide significant obstructions to TWYs A, F, and J at the approach end of RWY 6. The structure also obstructs line of site of the entire commercial area of the airport. This is of particular concern for the intersection of TWY A and the air carrier ramp. In addition the RYW 24 and end and TWY B are obscured. Some of the trees may be slated for removal,

but for the most part they are in wetlands. Melinda Montgomery stated that moving Site 1 would not provide any additional benefit.

6) Due to the obstructions identified above, Melinda Montgomery and Brian Murphy determined this site to be non-viable.

c. Site 2 (Brian Murphy)

1) Orientation – SW

2) Tower Height – Site 2 was initially reviewed at 63 feet AGL cab floor. Site 2 was then raised to 93 ft AGL cab floor.

4) Stairs – The stairs are in the correct location.

5) Columns/Mullions – Both column and mullions were shown. There are no column/mullion obstruction issues from either LC or GC. B. Murphy stated that Site 2 looks better with columns.

6) Obstructions – From GC, some of TWY H is blocked. May have difficulty seeing helicopters take off with TWY E. TWY H movement area is blocked; cannot see aircraft coming off the Signature ramp. While the ramp is a non-movement area, ATC provides cautionary instructions to aircraft on the ramp. TTN considers this a fairly significant issue; mitigations will need to be discussed.

7) Site 2 is a viable site.

d. Site 3

1) Orientation – NE

2) Tower Height – Site 3 was reviewed at 82 ft AGL cab floor. The maximum cab floor height for Site 3 is 85 ft AGL.

3) Stairs – The stairs are in the correct location.

4) Columns/Mullions – Both columns and mullions were shown. While viewing mullions, rotated the cab 5 degrees CW to get off hot spots (mullion between Sector D and Sector C that blocks the approach end of RWY 6, and mullion between Sector C and Sector B). Reassessed columns with the 5 degree rotation, no new hotspots.

5) Obstructions – There are no obstructions from either LC or GC. From GC, TWY E is a little obstructed, but this can be mitigated with controller movement.

6) Site 3 is a viable site

4. Siting will be conducted on August 10-11, 2021. The team will site Site 2 and Site 3. The airport will likely conduct one day in M. Montgomery's office and one day in the county building. All other participants will be remote. S. Teel will coordinate with Jeff Fischer and Prudence Tuyishimire to ensure audio needs are met for the meeting.

5. Actions

   a) S. Teel will obtain engineering feedback regarding any mullion/column advantages for cab glass fogging, leaking and moisture issues prior to the siting.

   b) S. Teel will send the Model Validation form for signature.

APPENDIX J – SAFETY RISK MANAGEMENT DOCUMENT

Proposed New Federal Contract Tower
For Trenton-Mercer Airport (TTN)

Federal Aviation Administration

September 1, 2021

Title: Comparative Safety Assessment (CSA) for Proposed New Airport Traffic Control Tower (ATCT) at Trenton-Mercer Airport (TTN)

Submitted By: _____ _____
Jay Arrington, Tech Writer, AJV-C12 Date

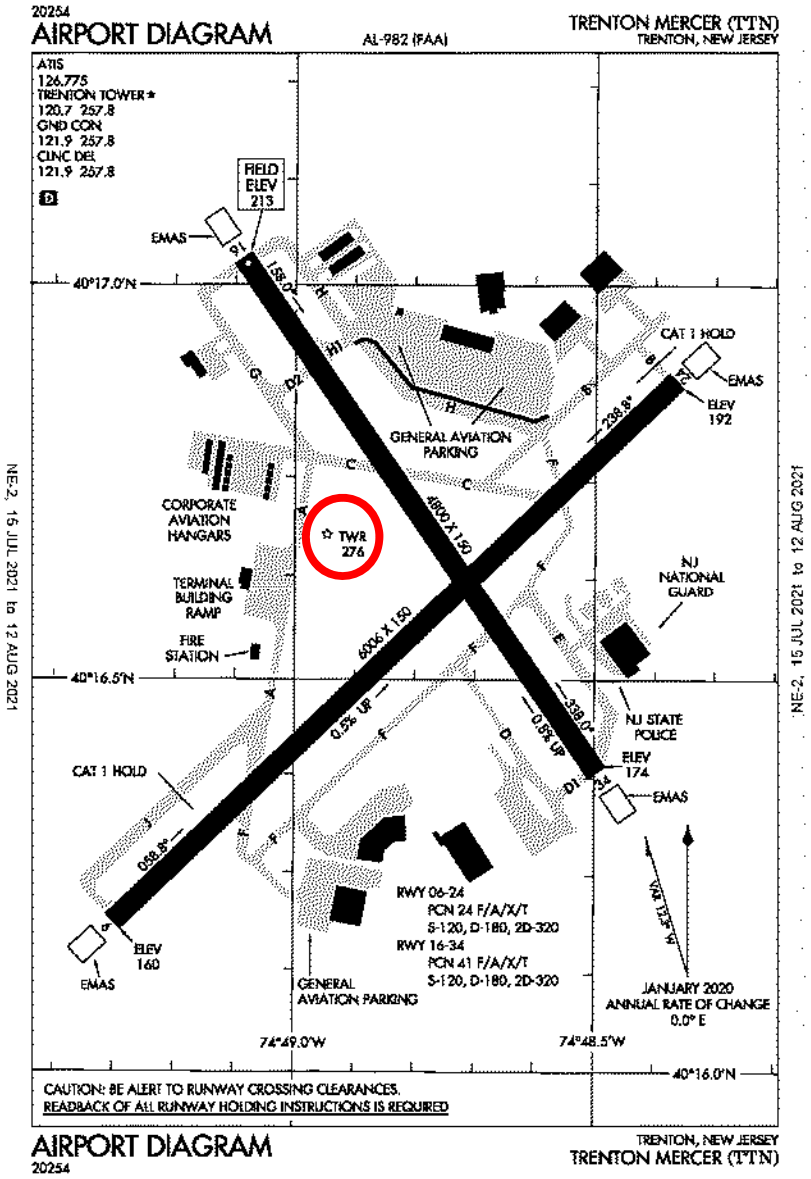
Concurrence By: *Signed electronically in SMTS, see below*
Karl Howard, SMS Specialist, AJV-C12 Date

Approved By: *Signed electronically in SMTS, see below*
James C. Schultz, Air Traffic General Manager Date

SECTION 1: CURRENT SYSTEM

The Trenton-Mercer Airport (TTN) is located in Trenton, New Jersey, about 40 miles northeast of Philadelphia. The airport has two intersecting runways: Runway (RWY) 6/24 (4,800 feet) and RWY 6/24 (6,006 feet). Both surfaces are 150 feet wide. The current Airport Traffic Control Tower (ATCT) is located in on the western side of the airfield, near the intersection of the runways, as circled in Figure 1 below.

Figure 1 Current Airport Diagram



SECTION 2: DESCRIPTION OF PROPOSED CHANGE

A new ATCT is being explored for TTN. A 3-D model, virtual reality (VR) proof-of-concept siting took place August 10–11, 2021 at the airport and via Zoom during which the FAA Terminal Facilities Siting team conducted an assessment using site data provided by the FAA personnel and the airport authority. The siting assessment was completed using 3-D goggles. The goal was to assess efforts and apply the best outcome in order to determine the best possible position on the airfield for the new tower.

After looking at several possible new tower sites, one location was recommended by the siting team and staff at TTN. Another location was considered that had no additional issues regarding line of sight; however, the recommended site had distinct advantages. "Site 3" is the recommended location and is the sole site discussed in this Safety Risk Management Document (SRMD). An additional site (Site 2) was also evaluated; information regarding Site 2 can be found in the attached Hazard Analysis Worksheet (HAW).

Details for site 3 are as follows:

- The location of the tower's four corners based off preliminary TERPS data are:
  - PT #1 – 40 16 34.39 N - 74 48 29.45 W
  - PT #2 – 40 16 34.47 N - 74 48 29.14 W
  - PT #3 – 40 16 34.22 N - 74 48 29.04 W
  - PT #4 – 40 16 34.14 N - 74 48 29.36 W

- Cab Floor Level – 82 feet Above Ground Level (AGL)
- The site's location is 40°16'34.31"N / 74°48'29.25"W
- Eye Level – 87 feet AGL
- Top of Tower – 117 feet AGL (35 feet above cab floor; 30 feet above eye level)

Figure 2 represents an approximation of the site determined to be a feasible location during the siting process. There is no negative impact on published precision and non-precision approaches.

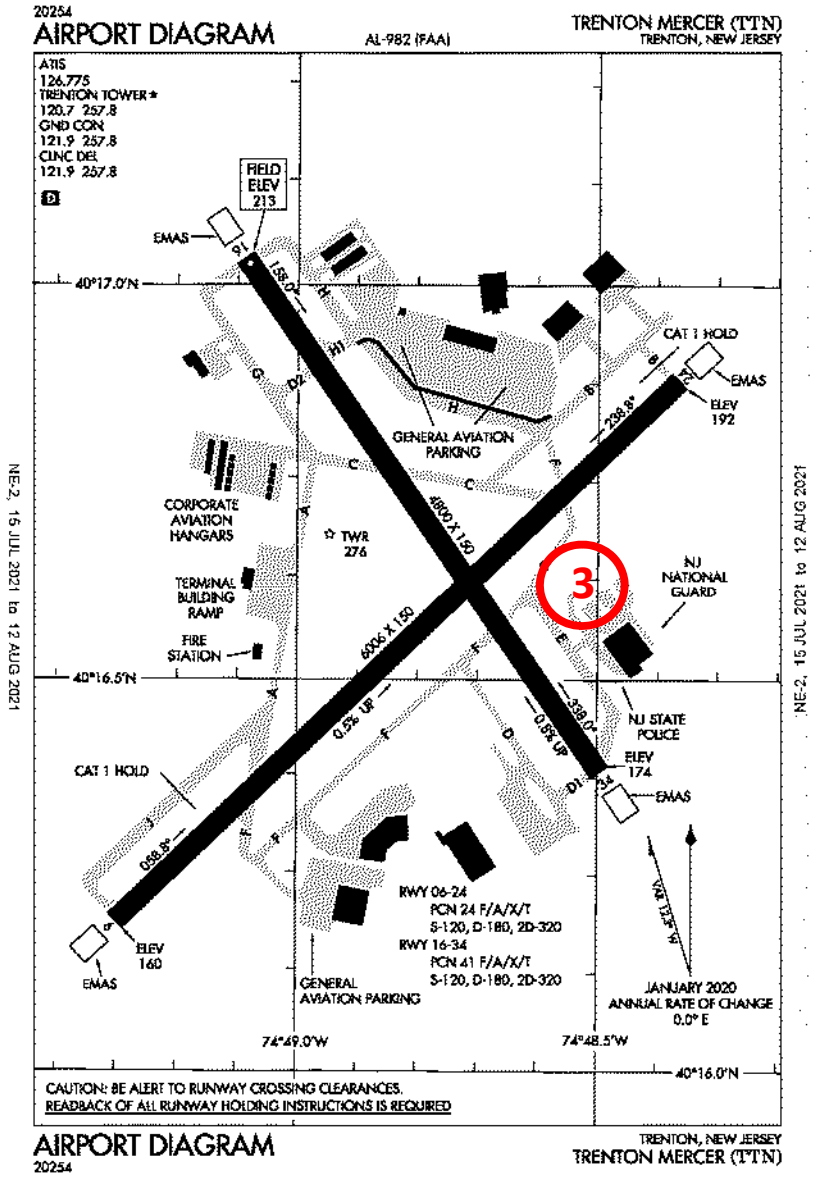


Figure 2 Proposed New Tower Site

SECTION 3: SRM Panel Members

An Air Traffic Organization (ATO) Safety Risk Management Panel (SRMP) was conducted August 11, 2021 to analyze and assess the TTN preferred site and the impact to air traffic safety.

Participants included:

Panel Members:

- Bryan Murphy, TTN Air Traffic Manager

Subject Matter Experts:

- Franklin E. Boyer, AJW Terminal Facilities National Coordinator (Liaison)
- Fred Rasche, Engineering Manager
- Jeff Fischer, 3-D Modeler
- Matthew Ballon, 3-D Modeler
- Scott Iwamoto, AJW Technical Operations Engineering Services, AJW-2C11
- Shari Teel, AJW Terminal Facilities National Coordinator
- Parshua Shah, DY Consultants
- Philip Barr, NAS Planner
- Brian Gearheart, Airports District Office
- John Seliga, Federal Contract Tower Project Implementation Manager
- Lyor Dehan, DY Consultants
- Shawn Reddinger, TERPS
- Melinda Montgomery, Airport Authority

SECTION 4: Rational for Safety Finding Without Hazards

A Comparative Safety Analysis (CSA) was conducted for the proposed new ATCT at TTN. The purpose of conducting the assessment was to apply the Safety Risk Management (SRM) process as defined by the ATO Safety Management System (SMS) Manual, April 2019 version.

The CSA was used to determine relative risk between viable/preferred sites; one site was eliminated prior to the assessment. The same procedures were applied to the final two sites to determine whether or not any additional risk would be introduced into the National Airspace System (NAS) by their proposed locations. The Terminal Facilities Siting team used TTN ATC personnel to conduct the evaluation of the preferred sites using the 3-D model and VR goggles, to assess the Line-Of-Sight (LOS) and detect any obstructions. Representatives from the FAA, TTN ATCT, user groups and the TTN airport authority also participated in siting activities. The team followed the alternate siting process in the draft FAA Siting Order 6480.4C to determine the viable/preferred/recommended site(s).

SRMP attendees conducted a safety analysis on Site 2 and Site 3 based on the Preliminary Hazard List (PHL) method from the ATO SMS Manual, April 2019 version, and using Appendix C, Table C-3 of the draft FAA Siting Order 6480.4C. The PHL is shown below with a

list of SRMP attendees' comments, observations and findings for Sites 2 and 3 according to PHL section topics.

While wearing VR goggles, TTN representatives were able to view movement and non-movement areas from the sites. They were able to see all critical airport locations and easily identify objects without impact to performance or depth perception.

Initially, there was a LOS issue with Site 3, but that was resolved when the Local Control and Ground Control positions were swapped in the cab. Staff did prefer columns over mullions in the cab, which created a better view of the airfield. Slat wall, instead of traditional consoles, also provided improved sight for the movement areas.

Site 2 had one minor issue regarding the ability to see non-movement areas. While not required to see these areas, controllers stated they would like to be able to view these areas for an additional layer of safety.

A detailed review of siting questions for both Site 3 and Site 2 are included.

It was also stated that the current position of the airport beacon could shine into the proposed tower cab, but it would be shielded prior to the opening of the ATCT using methods in place at other facilities in the NAS or moved to the top of the new ATCT.

Based on controller observations, it was determined that Site 3 was the best site and meets the needs of controllers. Site 3 introduces no risk into the NAS and further analysis is not required per the ATO SMS Manual.

TTN Site 3

TTN Site 3	Cab floor 82 AGL; eye level 87 AGL	
Item	**Concerns, Causes and Effects**	**Description**
1. Potential interference with navigation equipment both planned and existing	TBD	
2. Potential interference with communication equipment both planned and existing	TBD	
3. Potential interference with existing and or proposed surveillance equipment	TBD	
4. TERPS surfaces penetrations	TBD	
5. Part 77 surfaces penetrations	TBD	
6. Relevant Airport Design standards violated	TBD	
7. Direction of view		
7 a. North	No concerns	
7 b. East	One collision in the way of RWY 24 approach	Controller can shift left or right to alleviate the concern
7 c. West	No concerns	
7 d. South	No concerns	
8. Line of sight/angle of view		
8 a. Up	No concerns	
8 b. Down	No concerns	
9. Visual Performance		
9 a. Unobstructed view	From LC, a small portion of TWY E is slightly blocked, a little bit of NMA blocked	The blocked hangars private use, there is an obscured spot on TWY E, but it can be resolved by controller moving head. View from GC is fine
9 b. Object Discrimination	No concerns	
9 c. Line of Sight (LOS) Angle of Incidence	No concerns	
9 d. Two-Point Lateral Discrimination	No concerns, improvement	
10. Lighting and Atmospheric Limitations – Daylight		
10 a. Sun Angle	No concerns	
10 b. Sun Glare	Current system has sun glare for all seasons, and the controllers are used to it. No new issues	New tower effects RWY 16 and TWY G at sunset
10 c. Sun Shadows	No concerns	
10 d. Thermal Distortion	No concerns	
10 e. Light changes/contrast eye adaptation	No concerns	
11. Lighting and Atmospheric Limitations – Night		
11 a. Dawn	No concerns	
11 b. Dusk	See 10b	
11 c. Night	No concerns	
12. Artificial Lighting		
12 a. Airport lighting equipment outages	No concerns	
12 b. Lighting shadows	No concerns	
12 c. Airport lighting	No concerns	
12 d. Construction lighting	No concerns	
12 e. Residential/industrial lighting	No concerns	
12 f. Background clutter	No concerns	
13. Naturally occurring atmospheric conditions		
13 a. Dust	No concerns	
13 b. Ash	No concerns	
13 c. Smoke	No concerns	
13 d. Haze	No concerns	
13 e. Fog	No concerns	
13 f. Rain	No concerns	
13 g. Sleet	No concerns	
13 h. Snow	No concerns	
13 i. Sun glare off snow	No concerns	
13 j. Minimum ceiling heights (historical data)	No concerns	
14. Industrial/municipal discharges		
14 a. Dust	No concerns	
14 b. Ash	No concerns	
14 c. Smoke	No concerns	
15. Access to proposed site does not cross existing ground/air traffic patterns	No vehicular crossing of movement areas	
APTIL Trip #2		
16. Interior physical barriers		
16 a. Position of ATC in Tower Cab	No issue	
16 b. Position of Tower Cab equipment	No issue	
16 c. Position of Tower Cab outfitting	No issue	
17. Exterior physical barriers		
17 a. Construction equipment	No issue	
17 b. Proposed new structures and Airport expansion (ALP)	No issue	
17 c. Existing ATCT	ATCT has no issue	
18. Other	May have issue with existing beacon on existing tower	Can be shielded, or moved to top of new tower if old ATCT is razed
	No issues with potential tower construction from current cab that cannot be mitigated by controller movement. May have a small blockage of TWY A blocked during phasing, but TWY would be closed during that phase	Not part of the siting assessment, but will be addressed later after construction phasing plan is created

TTN Site 2

TTN Site 2	Cab floor 93 AGL; eye level 98 AGL	
Item	**Concerns, Causes and Effects**	**Description**
1. Potential interference with navigation equipment both planned and existing	tbd	
2. Potential interference with communication equipment both planned and existin	tbd	
3. Potential interference with existing and or proposed surveillance equipment	tbd	
4. TERPS surfaces penetrations	tbd	
5. Part 77 surfaces penetrations	tbd	
6. Relevant Airport Design standards violated	tbd	
7. Direction of view		
7a. North	No issues	
7b. East	No issues	
7c. West	No issues	
7d. South	No issues	
8. Line of sight/angle of view		
8a. Up	No issues	
8b. Down	No issues	
9. Visual Performance		
9 a. Unobstructed view	Small portion of TWY H is blocked in front of Signature hangar, column blocks a Hot Spot on approach end of RWY 16	Can be mitigged by controller movement; Signature rain is HIAA. TWY H is a blockage, but you can see the AC going behind the building and coming out. Maybe 100 yards. It is concerning, but not hazardous. Would be an issue if helicopter was not visible from the tower. Helo would be departing at own risk. Controls exist to mitigate this risk. ATC is comfortable with scenario.
9 b. Object Determination	No issues	
9 c. Line of Sight (LOS) Angle of Incidence	No issues	
9 d. Two-Point Lateral Determination	No issues	
10. Lighting and Atmospheric Limitations – Daylight		
10 a. Sun Angle	No issues	
10 b. Sun Glare	No issues	
10 c. Sun Shadows	No issues	
10 d. Thermal Distortion	No issues	
10 e. Light changes/contrast eye adaptation	No issues	
11. Lighting and Atmospheric Limitations – Night		
11 a. Dawn	No issues	
11 b. Dusk	No issues	
11 c. Night	No issues	
12. Artificial Lighting		
12 a. Airport lighting equipment outage	No issues	
12 b. Lighting shadows	No issues	
12 c. Airport lighting	No issues	
12 d. Construction lighting	No issues	
12 e. Residential/industrial lighting	No issues	
12 f. Background clutter	No issues	
13. Naturally occurring atmospheric condition		
13 a. Dust	No issues	
13 b. Ash	No issues	
13 c. Smoke	No issues	
13 d. Haze	No issues	
13 e. Fog	No issues	
13 f. Rain	No issues	
13 g. Sleet	No issues	
13 h. Snow	No issues	
13 i. Sun glare off snow	No issues	
13 j. Maximum ceiling heights (historical data	No issues	
14. Industrial/municipal discharge		
14 a. Dust	No issues	
14 b. Ash	No issues	
14 c. Smoke	No issues	
15. Access to proposed site does not cross existing ground/air traffic pattern	No crossing of movement areas to get to new ATCT	
AFTIL Trip #2		
16. Interior physical barrier:		
16 a. Position of ATC in Tower Cab	no issues	
16 b. Position of Tower Cab equipment	no issues	
16 c. Position of Tower Cab mullions	no issues	
17. Exterior physical barrier:		
17a. Construction equipment	no issues	
17b. Proposed new structures and Airport expansion (ALP)	no issue	
17c. Existing ATCT	no issues	
18. Other	May have issue with rotating beacon on existing tower	Can be shielded, or moved to top of new tower if old ATCT is razed
	No issues with potential tower construction from current cab that cannot be mitigated by controller movement. May have a small blockage of TWY A blocked during razing, but TWY would be closed during that phase. The current tower would also have a small blockage of the ramp for the main terminal, as well as the new terminal	Not part of the siting assessment, but will be addressed later after construction phasing plan is created. ATC does not have any issues, as they can be mitigated with ATC movement.

* Human Factors data

TERPS: Based on the data provided, there are NO IMPACTS to any currently published Instrument Flight Procedures (IFPs). I evaluated all 4 corners of all 3 sites listed (12 points total). None of those points impact any IFPs at TTN.

Here are the preliminary results for NEH considering a RWY 6 ILS CAT II/III system

- Site 1 is outside the cat II/III eval area no change to the previous eval
- Site 2 NEH for RWY 6 ILS CAT II/III (if it were possible to upgrade the system at some future time) = 330 ft AMSL
- Site 3 NEH for RWY 6 ILS CAT II/III (if it were possible to upgrade the system at some future time) = 300 ft AMSL

TOPR: See Report

Tech Ops Preliminary Report (TOPR)
For
Trenton, NJ (TTN) ATCT Facility

August 2021

Limited Content - Not for Official Use

PROPOSAL:

The proposal is for a new ATCT with several potential locations at Trenton-Mercer Regional Airport (TTN).

ANALYSIS:

The proposal was analyzed using the NASWATCH iOEAAA tool as well as performing quantitative calculations for potential impacts to aviation facilities. Please see the following disclosure:

Not intended for supplemental use outside OESG Tech Ops purview. NASWATCH is an iOEAAA tool intended for use strictly by OESG Tech Ops in OE/AAA airspace case evaluation providing conservative results – dependent on facility type and available database resources within iOEAAA. A 7460 form is still required for official submission.

RESULTS:

The following nearby facilities were identified and analyzed for potential impacts with the following results:

- **Site 2**
  - **Current TTN ATCT** – Possible shadowing of existing ATCT to Taxiway A. Coordination with ATCT personnel will be required.
  - **TTN, TTNZ RTR** – **Using the existing tower cross sectional width as a reference, no potential impacts to the RTRs are anticipated.**
  - **TTN ARSR** – **Radar platform LOS is possible with positive elevation angle; Level 3 analysis needed.**

- **Site 3**
  - **Current TTN ATCT** – Possible shadowing of existing ATCT to Taxiway A. Coordination with ATCT personnel will be required.
  - **TTN, TTNZ RTR** – **Using the existing tower cross sectional width as a reference, no potential impacts to the RTRs are anticipated.**
  - **TTN ARSR** – **Radar platform LOS is possible with positive elevation angle; Level 3 analysis needed.**
  - **TTN Runway 06 LOC (CAT I)** – **Within Small Structure Protection Zone. Level 3 analysis needed.**

Limited Content - Not for Official Use

The predicted impacts to the nearby aviation facilities are depicted in the following pictures. The potential impact is calculated using the following ATCT elevations:

- Site 2:
  - Overall Tower Height – 325 ft. AMSL

- Site 3:
  - Overall Tower Height – 297 ft. AMSL

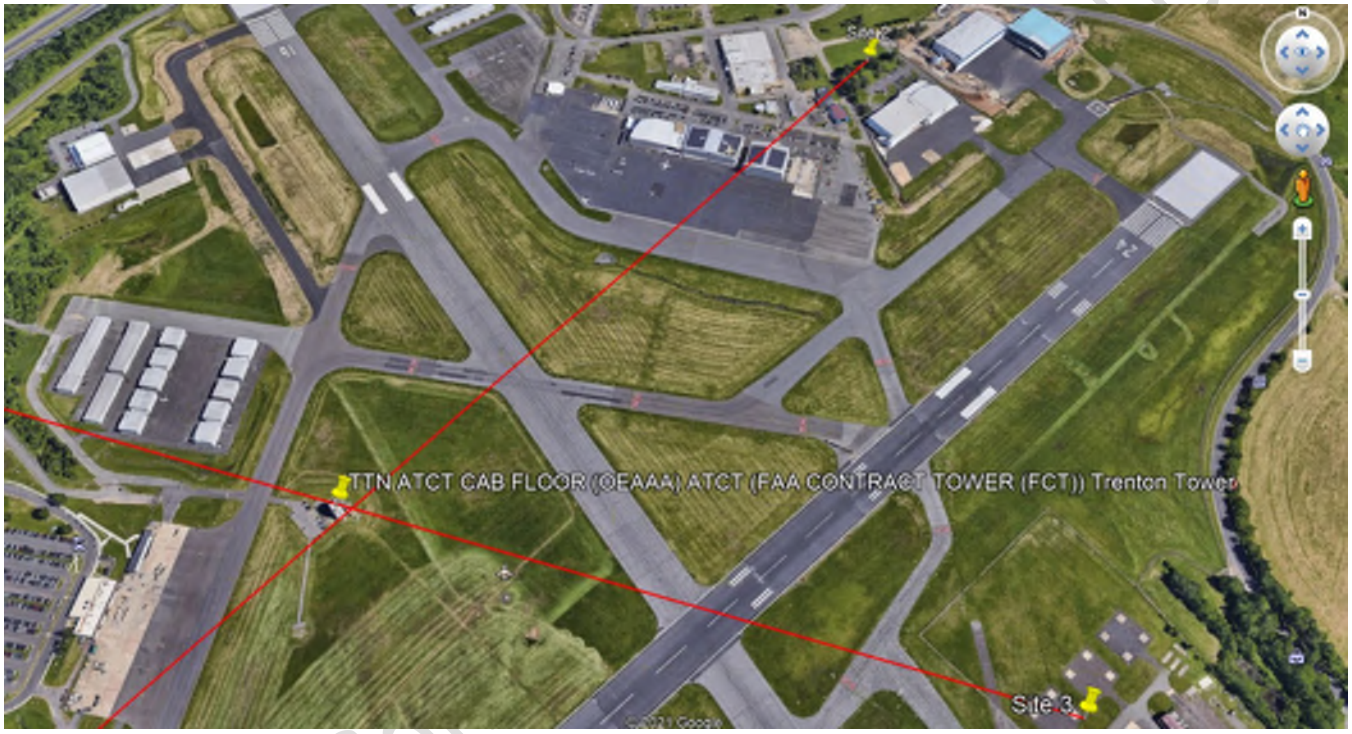

Figure 1. Current TTN ATCT

In calculating the potential impact for the current TTN ATCT, it was found that the following movement areas would experience optical Line-of-Sight blockage:

- **<u>Site 2, Site 3</u>**
  - Taxiway A

To confirm that this will not adversely impact the operations of the existing ATCT, additional coordination with Air Traffic personnel would be required.

Limited Co... Use

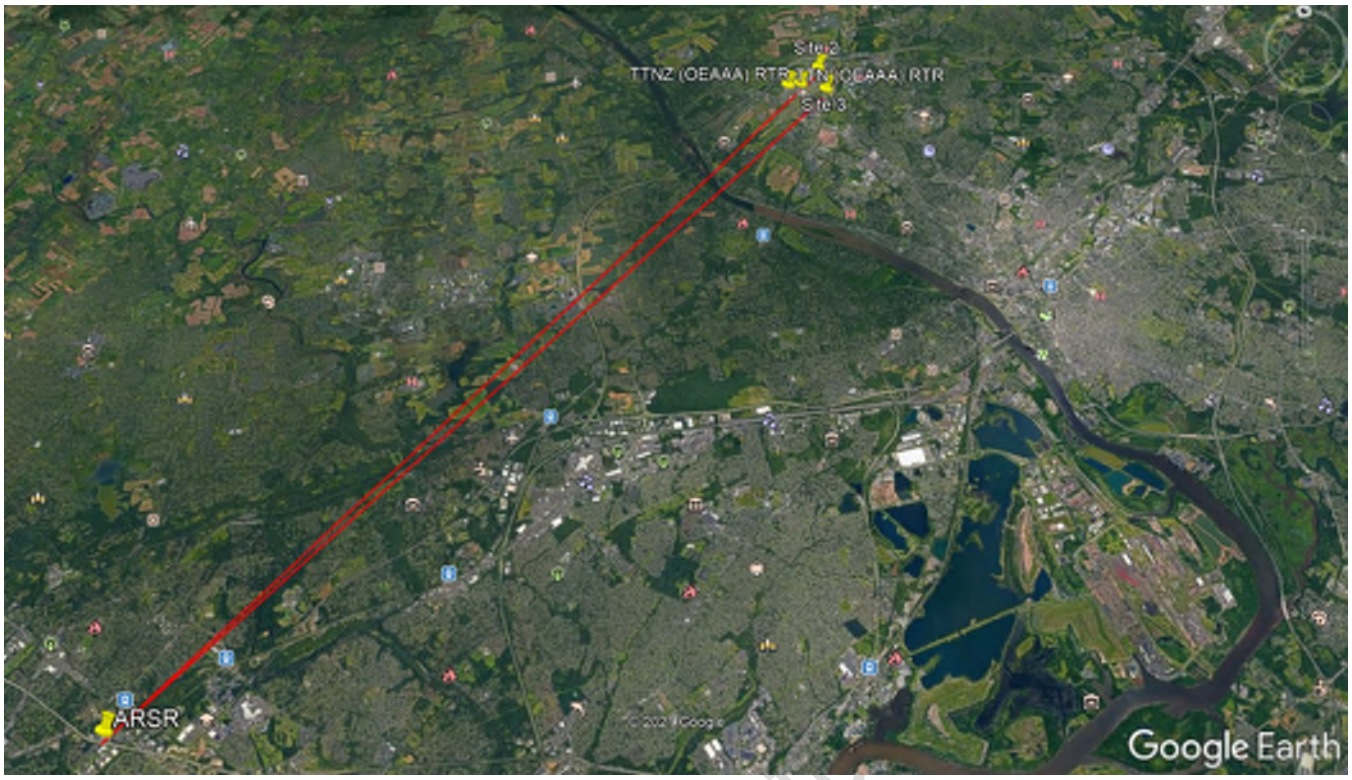

Figure 2. TTN ARSR

In calculating the potential impact for the TTN ARSR located approximately 70,000 ft. SSW of the proposed ATCT site locations at the closest point, it was found that the towers would have optical Line-of-Sight to the ARSR with a positive elevation angle since the proposed towers are higher than the ARSR Radar Platform Height. To confirm that this will not adversely impact the functionality of the ARSR, additional Level 3 analysis is needed.

Limited Content - Not

Figure 3. TTN Runway 06 LOC (CAT I)

In calculating the potential impact for the TTN Runway 06 LOC, located approximately 2500 ft. SSW of the proposed ATCT site locations at the closest point, it was found that Site 3 would be within the protection area for small structures. To confirm that this will not adversely impact the functionality of the LOC, additional Level 3 analysis is needed.

Shawn,

Please see the request below regarding the possibility of protecting Runway 6-24 for CAT II/III operations. Can you determine the NEH for the three sites in this scenario?

Thanks,
Shari

Subject: RE: TTN Preliminary TERPS Analysis

Hi Shari,

Thanks for the good news!!!
One of the additional considerations we have been thinking of, if possible, is to try protecting Runway 6-24 (primary) for CAT II/III operations even if the currently published IFPs are just CAT I on RW 6 and NIP on RW 24.
Is this something that Shawn can also take a look at to see what the NEHs could be, especially for Sites 2 and 3, if that runway happens to be upgraded? Or, this point should be discussed at a later stage with the rest of the team?

Again, this is not set-in-stone as we even don't know in detail if the existing airspace configuration, obstacles, etc. around TTN could allow for such upgrades… but it's an idea on the table and we tried locating the pre-sites away from that runway as much as possible with than in mind.
Please let me know what you think.

Thank you,

Prudence Tuyishimire

Cc: Boyer, Franklin E-CTR (FAA) <franklin.e-ctr.boyer@faa.gov>
Subject: TTN Preliminary TERPS Analysis

Prudence,

Based on the preliminary TERPS analysis provided by Shawn Reddinger using the provided pre-site data, there are NO IMPACTS to any currently published Instrument Flight Procedures (IFPs). All 4 corners of all 3 sites listed (12 points total) were evaluated. None of those points impact any IFPs at TTN.

In addition, the No Effect Heights (NEHs) are as follows:

Site 1 NEH 360 ft AMSL
Site 2 NEH 370 ft AMSL
Site 3 NEH 360 ft AMSL

Thank you,

AFLV Inspection Report

November 12, 2015

Mr. Dale Russell, PE
Urban Engineers, Inc.

TTN Airfield Lighting Vault Conditions

Dear Mr. Russell,

On 10/9/2015, Burns Engineering was on site for the kick off meeting for the rehabilitation of Runway 6-24 at Trenton-Mercer Airport. The design team also performed a site investigation of the airfield lighting vault and the airfield ground lighting systems. The investigation of TTN's airfield lighting vault revealed some electrical code inconsistencies and unsafe conditions. The following items identify the areas of greatest concern. Although this facility is functional, there are passive safety issues in addition to a lack of system redundancy.

Emergency Egress - The vault has only one method of entrance and exit which is the main door. The building does have windows, however, those windows are too small for most adults to fit through safely or the windows are blocked. The windows are also elevated approximately four (4) feet above the ground. For windows to be considered an emergency egress, they need to meet the requirements of IBC Section 1029 which states that the window has to be a minimum of 20x24" and no more than 44" above floor. Should a fire ignite inside the building near the door, any occupants could be trapped inside due to the layout of the building. This issue is magnified with the fact that the vault building also serves as a storage location for light fixtures, sign panels and other various equipment as can be seen in the photo below.

Equipment Installation - Furthermore, the photo below shows the wire way carrying all cabling from the regulators to the entire airfield is mounted to a piece of non-fire rated plywood located in the middle of the vault building. Access to the wire way is impeded by the constant current regulators (CCR). On the backside of the plywood wall, there are wires hanging from the ceiling which seem to be abandoned but were never removed.

Equipment Labeling - Another issue that was observed is inconsistent and inadequate labeling. In the main panelboard, some of the breakers are labeled, while other breakers are missing all together as can be seen in the photo below. Of greater safety concern is that none of the equipment within the vault has arc flash labeling to identify the proper personal protective equipment required to service the equipment.

Equipment Spacing – The National Electric Code has requirements for the spacing of electrical equipment to prevent personnel from being surrounded by live electrical

equipment. The vault equipment layout is deficient in this category. Further, the orientation of the equipment does not lend itself to system redundancy. If a CCR fails taking out a critical airfield lighting circuit, a spare CCR cannot be easily placed on-line to get that circuit operational.

Airfield Infrastructure - Once airfield lighting cabling leaves the vault building, it goes through a 16" light base junction box as shown in the photo below. The cables did not appear to be labeled. The light base is not a sufficient size for that many cables and causes maintenance and troubleshooting issues and can delay service restoration. Typically, the cables exiting an airfield lighting vault will transition through a manhole or handhole that allows for the proper racking and bending radii of the cabling.

Summary - The airfield lighting vault at TTN has deficiencies, and it is recommended that the safety issue within the facility be addressed. These safetyconcerns apply to TTN personnel and contractors who enter the vault as well as the safety of the air traffic at TTN should a failure within the vault occur. It is recommendation that an analysis of the vault be performed to identify measures that will allow the vault to comply with safety regulations and guidelines.

EXECUTIVE SUMMARY

Richard Grubb & Associates, Inc. completed a Phase IA historical and archaeological survey and Intensive-level historic architectural survey for proposed improvements to the Trenton-Mercer Airport located at 1100 Terminal Circle Drive and along Scotch Road in Ewing Township, Mercer County, New Jersey. The project encompasses the preferred alternatives for the demolition of the current Air Traffic Control Tower (ATCT) and the construction of a new ATCT located approximately 2,093 feet southeast of its current location. The purpose of the Phase IA historical and archaeological survey was to assess the potential for the presence of pre-Contact period Native American and/or historic archaeological resources within the Area of Potential Effects for Archaeology (APE-Archaeology) and to make recommendations for further survey, if warranted. The purpose of the Intensive-level historic architectural survey was to identify historic architectural resources listed in the New Jersey Register of Historic Places (NJR) and/or National Register of Historic Places (NRHP) or eligible for the NRHP and to determine the potential for the project to affect above-ground historic architectural resources within the APE for Historic Architecture (APE-Architecture) that are listed in or eligible for the NJR or NRHP.

Background research indicated that no registered archaeological sites are situated within or adjacent to the APE-Archaeology and five archaeological sites are located within 1 mile. Nearly all of the APE-Archaeology exhibited disturbance with the exception of grassy areas surrounding three helicopter pads near the National Guard facility. Undisturbed grassy areas within 500 feet of the former alignment of the West Branch Shabakunk Creek have an assessed high sensitivity for pre-Contact period Native American archaeological resources. The remainder of the APE-Archaeology has an assessed low pre-Contact and historic archaeological sensitivity. A Phase IB archaeological survey is recommended only in areas of assessed high archaeological potential. No further archaeological survey is recommended elsewhere.

The Intensive-level historic architectural survey concluded that there are two historic districts and one historic property eligible for listing in the NRHP located within the APE-Architecture: the Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996), the Delaware and Bound Brook (Reading) Railroad Historic District (D&BBRRHD) (SHPO Opinion: 9/9/2005), and the First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008). Twenty-one resources of more than 50 years of age were surveyed at the intensive level including the Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996) (RGA 2) and the First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008) (RGA 3). The other surveyed resources are the mid-twentieth-century Trenton-Mercer Airport Complex (RGA 1), an early twentieth-century cemetery and crematory (RGA 12), an early 1970s shopping center (RGA 13), a mid-twentieth-century school (RGA 20), 11 houses built between the late nineteenth and mid-twentieth centuries (RGA 4–7, 14–19, and 21), a mid-twentieth-century gas station (RGA 11), and 3 mid-twentieth-century industrial/commercial buildings (RGA 8–10). As a result of the survey, RGA agreed with the 2008 Certificate of Eligibility for the First Presbyterian Church and Cemetery of Ewing (RGA 3) and determined that the historic property does retain sufficient historic integrity to qualify for listing in the NRHP. Upon fieldwork, it was discovered that the Aeronautical Turbine Laboratory Complex Historic District (RGA 2) was in the process of being demolished resulting in the complete loss of its historic integrity. As such, it was recommended no longer eligible for listing in the NRHP. As currently designed, the proposed project will have no adverse effect on historic properties. No further historic architectural survey is recommended.

1.0 INTRODUCTION

Richard Grubb & Associates, Inc. (RGA) completed a Phase IA historical and archaeological survey and Intensive-level historic architectural survey for proposed improvements to the Trenton-Mercer Airport located at 1100 Terminal Circle Drive and along Scotch Road in Ewing Township, Mercer County, New Jersey (Figures 1.1 and 1.2). The project encompasses the preferred alternatives for the demolition of the current Air Traffic Control Tower (ATCT) and the construction of a new ATCT located approximately 2,093 feet southeast of its current location. The purpose of the Phase IA historical and archaeological survey was to assess the potential for the presence of pre-Contact or historic archaeological resources in the Area of Potential Effects (APE) for Archaeology (APE-Archaeology) and to recommend further survey, if warranted. The purpose of the Intensive-level historic architectural survey was to assess the National Register of Historic Places (NRHP) eligibility of newly identified above-ground historic resources within the APE for Historic Architecture (APE-Architecture) and to evaluate potential project impacts on above-ground historic resources listed in the New Jersey Register (NJR) and/or NRHP or eligible for listing in the NRHP within the APE-Architecture.

Underground utilities are also proposed. Given their sensitivity as critical infrastructure that may be targeted by terrorist attacks, proposed utility routes are not shown on project plans or report figures per Federal Aviation Administration (FAA) requirements. Such underground infrastructure route locations were assessed for their archaeological sensitivity.

RGA prepared this report for DY Consultants, consultant to Trenton-Mercer Airport. Theodore Gold, MA, RPA, served as the Principal Investigator for archaeology and Lauren Dunkle, MA, served as the Principal Investigator for historic architecture. The Principal Investigators meet the requirements of 36 CFR 61 set forth by the National Park Service (Appendix A). Lauren Dunkle, Matthew Goldberg, and Jane Nasta completed the New Jersey Historic Preservation Office (NJHPO) survey forms. Allison Gall conducted background research, and Patricia McEachen produced the report graphics. Lynn Alpert, MS, and Emma Durham PhD, RPA edited the report and Dr. Durham formatted the report. Copies of this report and all field notes, photographs, and project maps are on file at offices of RGA in Cranbury, New Jersey.

This report contains several appendices that consist of qualifications for Principal Investigators (Appendix A), summary of New Jersey and National Register of Historic Places criteria (Appendix B), project plans (Appendix C), record of public consultation (Appendix D), New Jersey Historic Preservation Office (NJHPO) architectural survey forms (Appendix E), unredacted report figures depicting the full APE-Archaeology (Appendix F), and an annotated bibliography (Appendix G).

Due to the need to restructure access to locational information for certain infrastructure, the utility route is not depicted as part of the APE-Archaeology on report figures for the version of this report intended for public consumption. The figures embedded in this report depict a partially redacted APE-Archaeology. A separate set of report figures showing the full APE-Archaeology are included in Appendix F, so that the appendix can be removed, as needed, from public-facing or publicly accessible versions of the technical report. The full APE-Archaeology was assessed for archaeological sensitivity as part of this report.

1.1 Regulatory Context

The FAA is the lead federal agency for the project, necessitating compliance with Section 106 of the National Historic Preservation Act (NHPA), as amended. According to Section 106 of NHPA, archaeological or historic architectural resources listed in or eligible for listing in the NJR and NRHP must be identified to determine if the project will have an effect on such resources. This report was also completed in support of an Environmental Assessment (EA) that is being prepared to address federal and state environmental review requirements. The

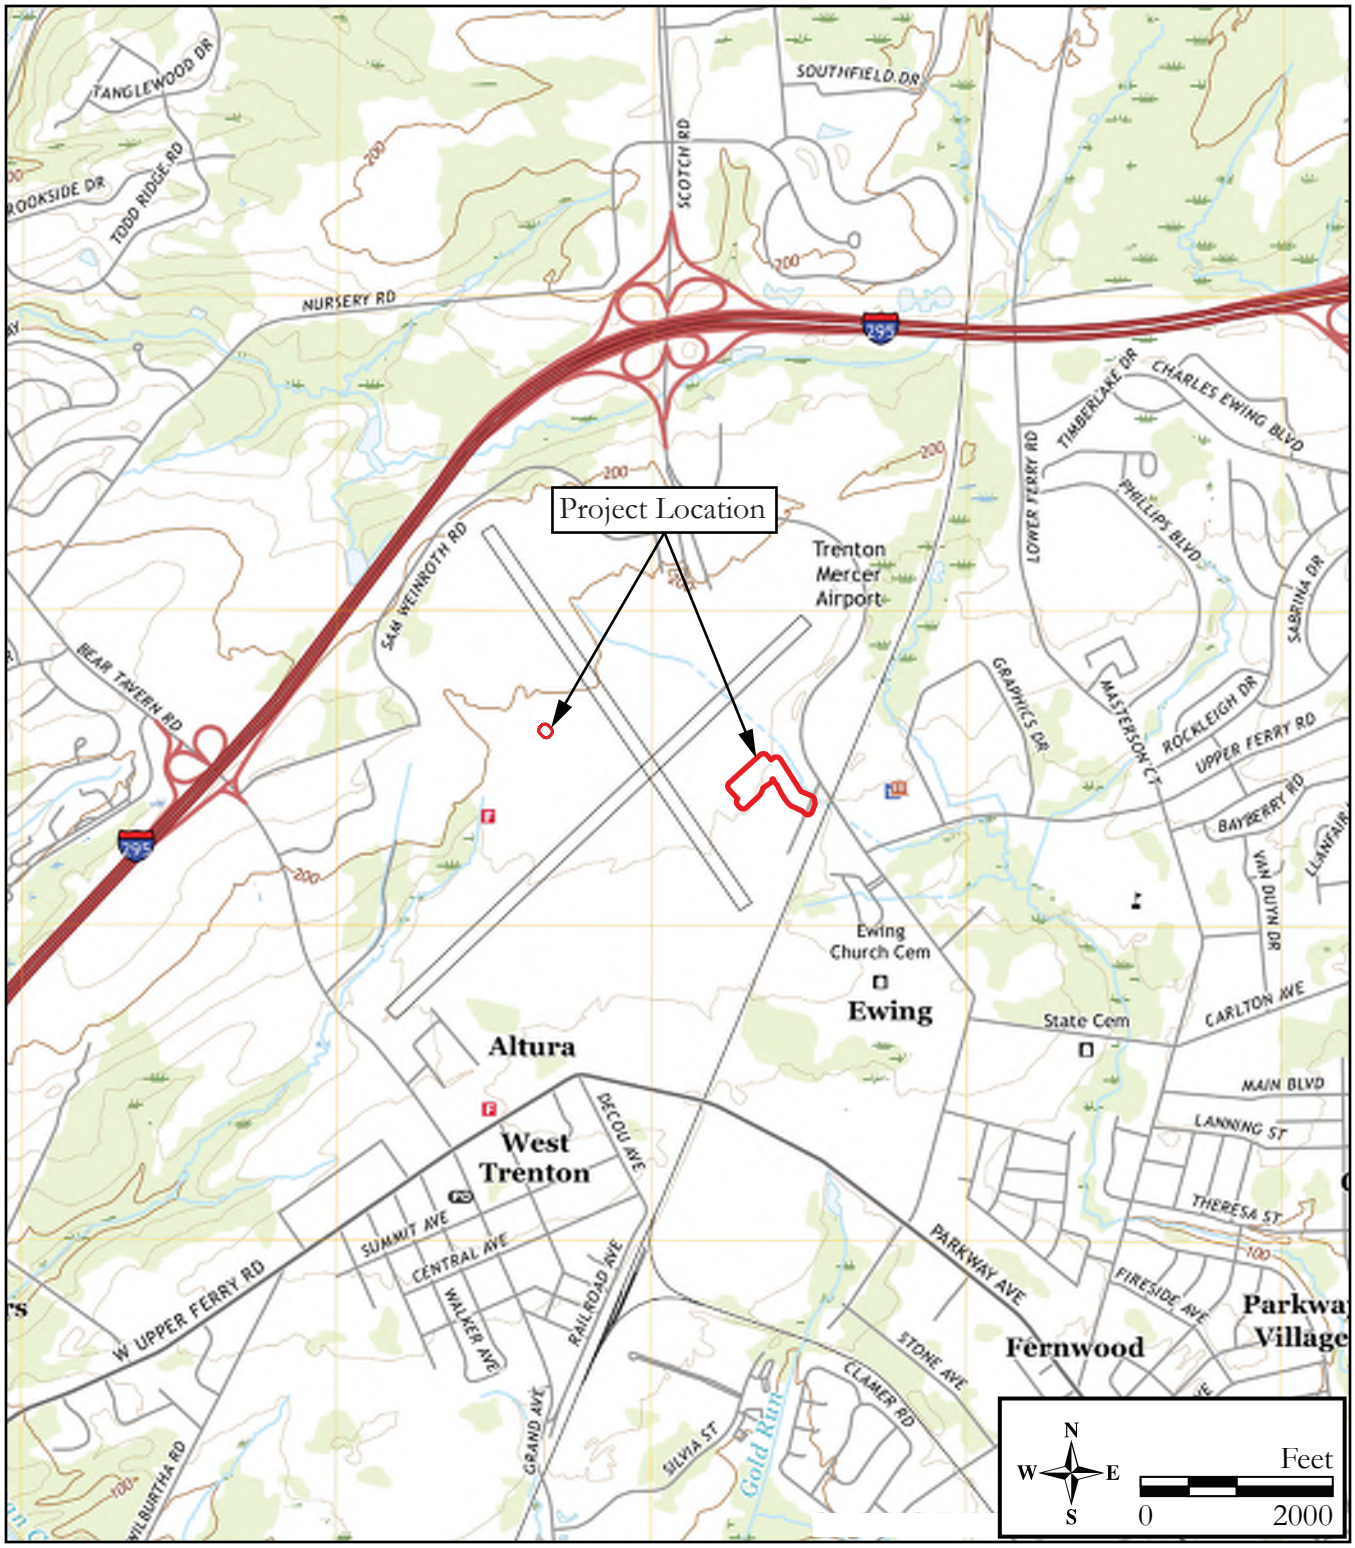

Figure 1.1: USGS map
(2019 USGS 7.5' Quadrangle: Pennington, NJ-PA).

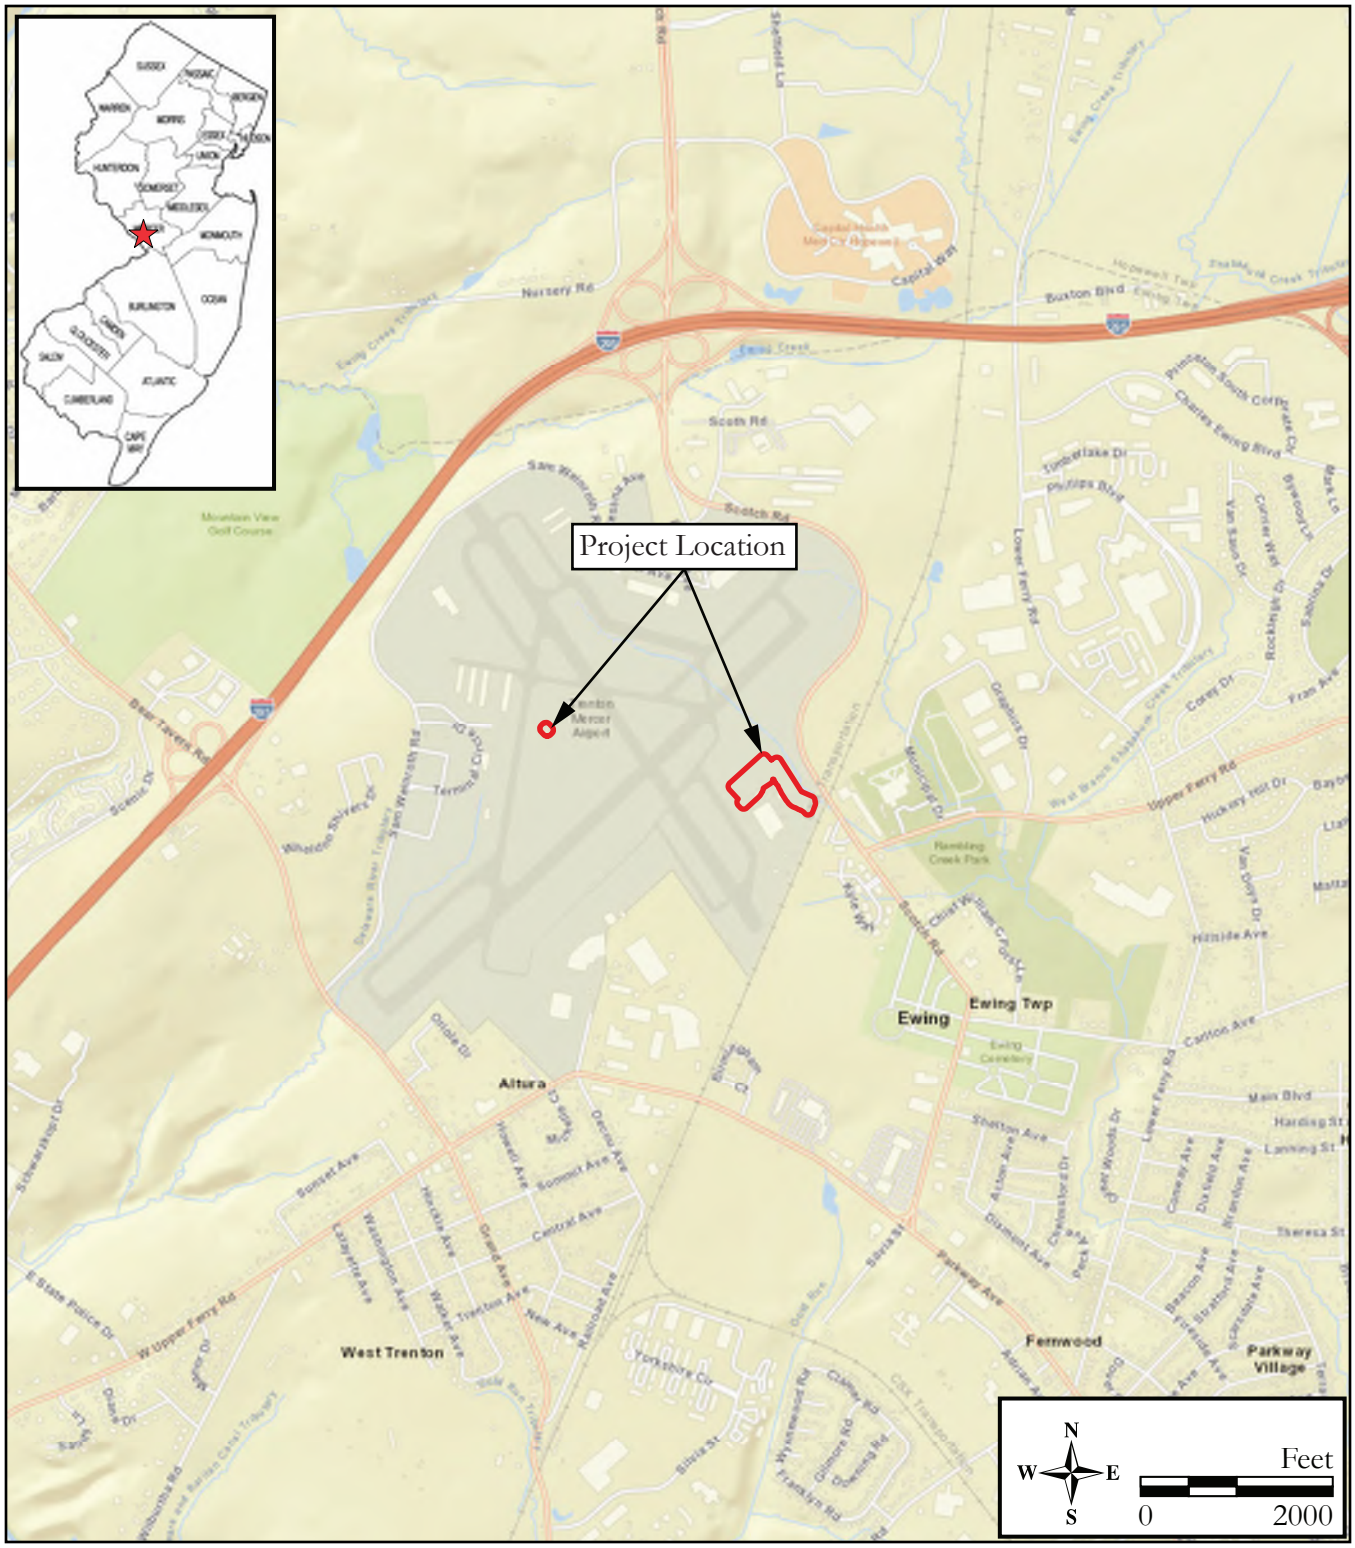

Figure 1.2: Road map
(Esri 2019).

EA is being prepared in accordance with FAA Order 5050.4B, "National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects," and FAA Order 1050.1F, "Environmental Impacts Policies and Procedures."

The surveys have been carried out in accordance with the Secretary of the Interior's *Standards and Guidelines for Archaeology and Historic Preservation*, and the archaeological survey guidelines and the *Guidelines for Architectural Surveys* of the NJHPO (1994, 1996; Splain 1999). This report consists of a brief discussion of the environmental setting, results of background research, results of an archaeological reconnaissance and sensitivity assessment, results of the Intensive-level historic architectural survey, and management recommendations.

1.2 Project Description

The proposed project includes the demolition of the existing ATCT and the construction of a new ATCT within the Trenton-Mercer Airport. The proposed new ATCT will be located approximately 2,000 feet to the southeast of the existing tower and will have a total height of approximately 117 feet, which is approximately 32 feet taller than the existing tower. The proposed tower will consist of seven floors with two break rooms, an FAA equipment room, an airport equipment room, a manager's office, and the cab on the uppermost level (see Appendix C). An Airport Rotating Beacon measuring approximately 41.25 inches in height will be installed on the top of the new tower. Approximately 10 narrow antennas and 4 15-foot-tall lighting protection air terminal masts will also be installed around the perimeter of the roof. Materials for the new tower will primarily be precast concrete and metal cladding and finishes.

Additional improvements include the following: a concrete-encased ductbank for ground-to-air communication and antenna relocation, airfield lighting connection, and navaids; a parking lot and access road for the new ATCT; and a proposed water line, gas line, and sanitary line. This project encompasses the preferred alternative for the proposed ATCT (designated the ATCT Area) (Figure 1.3).

As described at the end of Section 1.1, the route of proposed underground utilities is not depicted on integrated report figures or construction plans per FAA guidelines (see Section 1.1 above).

1.3 Area of Potential Effects

The APE includes locations that may be impacted by construction or that may experience effects once construction is completed. The APE was defined in accordance with 36 CFR 800.16(d), which defines the APE as "the geographic area or areas within which an undertaking may directly or indirectly cause changes in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking."

The APE takes into account all locations where an undertaking may result in disturbance of the ground, from which elements of the undertaking may be visible, and where the activity may result in changes in traffic patterns, land use, and public access, for example. Project effects on historic resources may include both physical effects and contextual effects. Direct physical effects could include physical destruction, demolition, damage, or alteration of a historic resource. Indirect contextual effects may include isolation of a property from its surrounding environment; the introduction of visual, audible, or atmospheric elements that are out of character with a property or that alter its setting and context; or elimination of publicly accessible views to the resource. For clarity, this report identifies a distinct APE-Archaeology and APE-Architecture.

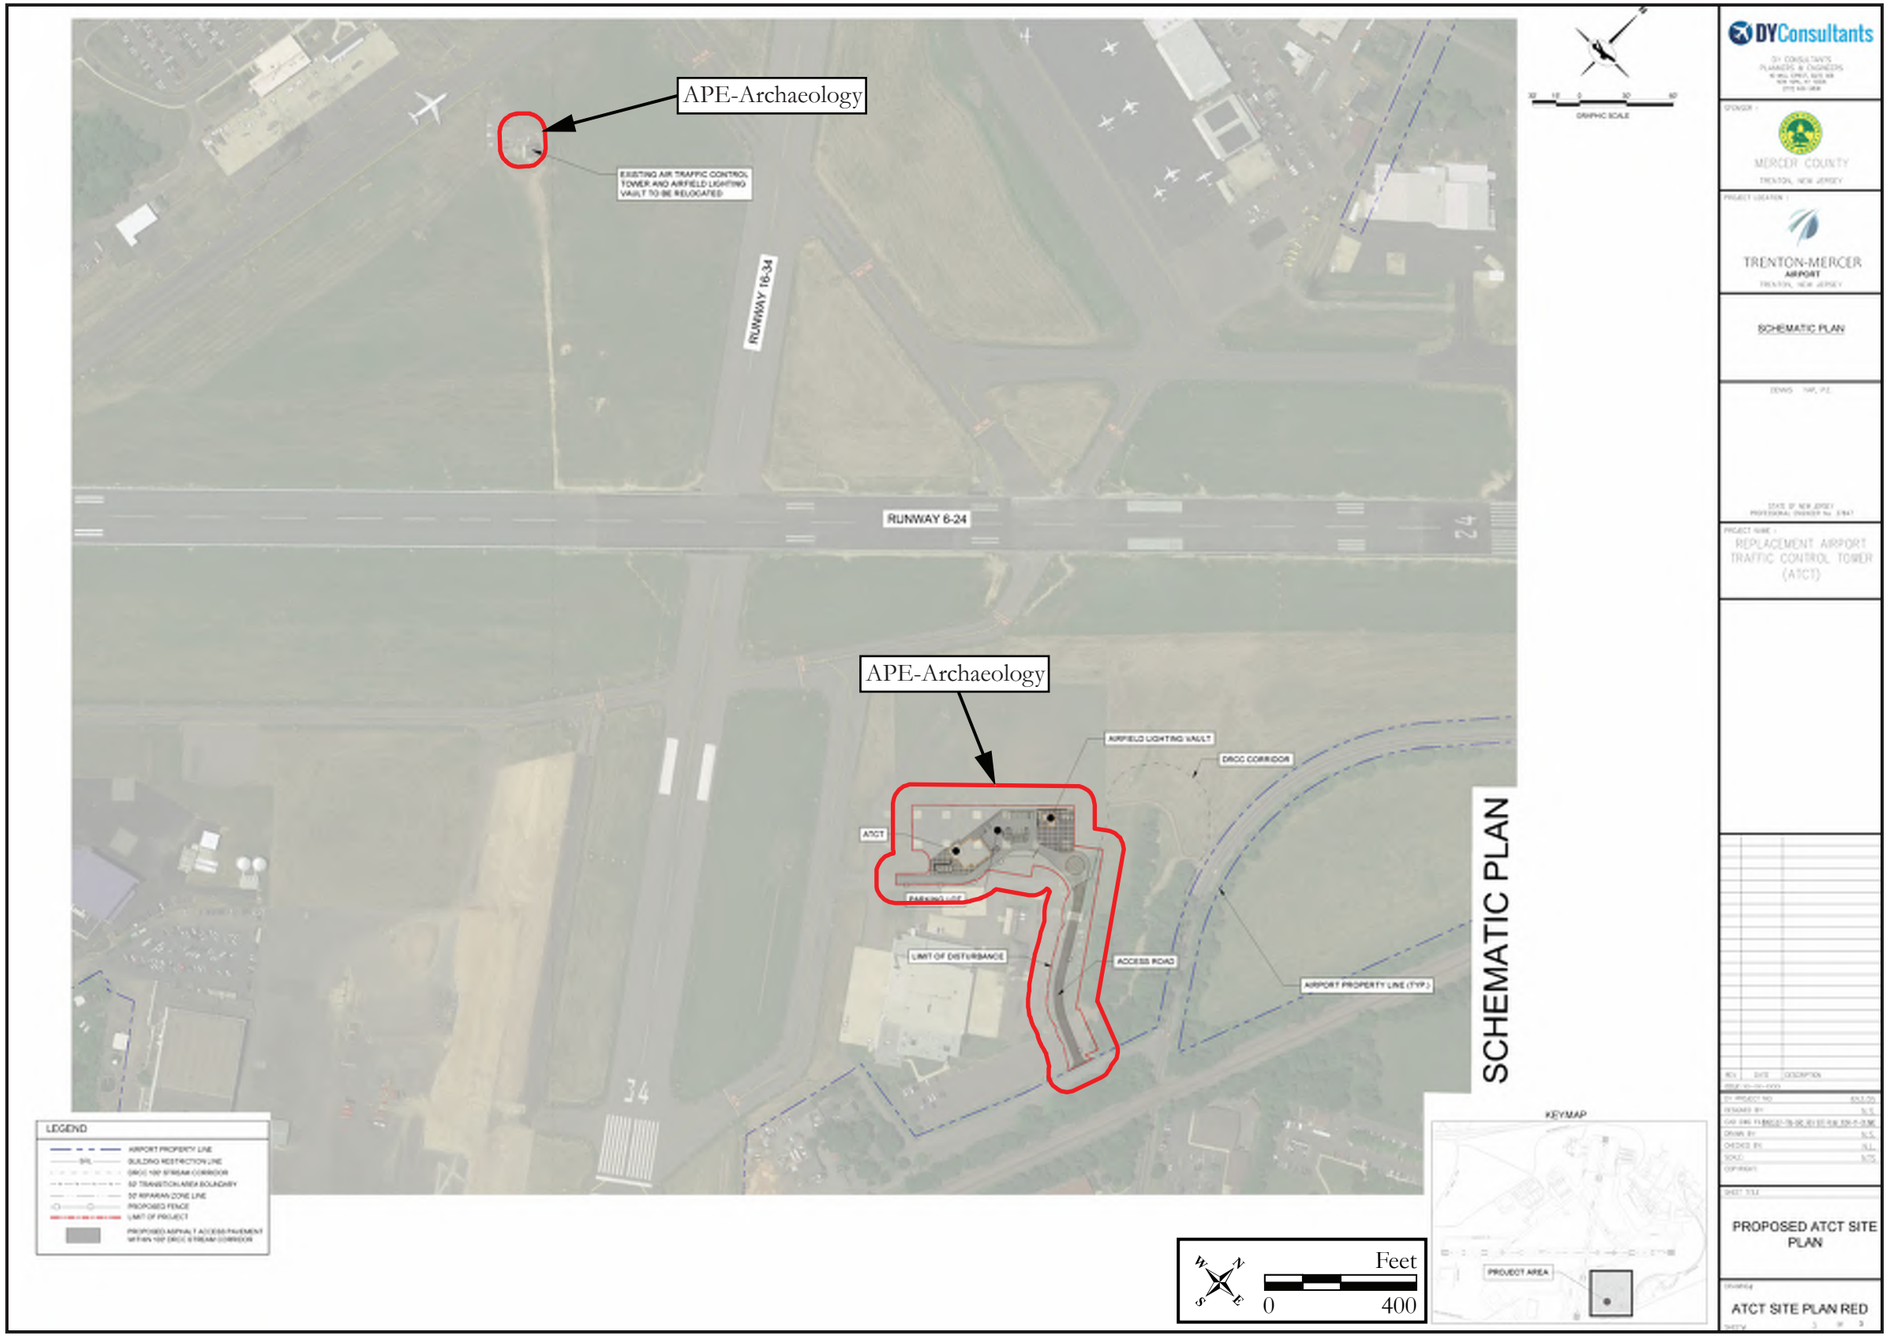

Figure 1.3: Proposed construction plans showing the partially redacted APE-Archaeology (Davey Research Group 2024).

APE-Archaeology

The APE-Archaeology encompasses any area of land disturbance required for obtaining permits or for successful completion of the project. Land disturbances include, but are not limited to, areas subject to excavation or deep grading, wetlands mitigation sites, construction staging areas, or borrow areas opened expressly for the project. For this project, the boundary of the APE-Archaeology encompasses the areas of the proposed ATCT facility, 20-space parking facility, access road, and turnabout island (see Figure 1.3). A 50-foot buffer around the existing ATCT and airfield lighting vault, the new ATCT, new parking lot, new access road, and new utility alignment is included in the APE-Archaeology to account for associated demolition activity/construction/staging.

The portion of the APE-Archaeology that follows the route of proposed underground utilities is not depicted on report figures per FAA guidelines. As a result, this section of the APE-Archaeology has been redacted on integrated report figures (see Section 1.1 above).

APE-Architecture

The APE-Architecture includes the area in which the project may directly or indirectly cause changes in the character or use of historic properties. This includes all properties within or adjacent to the area of planned construction impacts. To account for potential visual or contextual effects, the APE-Architecture extends beyond the actual construction limits (APE-Archaeology) to include those properties that may be impacted by visual changes, patterns of use, or may experience a change in historic character associated with the proposed project.

The increased height and the relocation of the tower within the Trenton-Mercer Airport complex will result in a change in visibility from outside of the airport. To verify the visibility of the new ATCT, a 1-mile buffer was used to delineate the APE-Architecture. Though comparable guidelines for cellular communications towers suggest a 0.5-mile buffer for proposed towers under 200 feet, the full mile was considered to ensure that potential effects of the lighted beacon would be accounted for (Federal Communications Commission 2004:B-17). Within the 1-mile buffer, GIS-based viewshed modeling determined where the undertaking has the potential to be seen from historic resources and properties (Figure 1.4). The viewshed was further broken down to distinguish areas where the existing ATCT is currently visible from areas where the new ATCT will be newly visible. Areas where an ATCT will no longer be visible after the existing ATCT is removed were also delineated. Modeling showed that while some locations around the airport would experience increased visibility due to the relocation of the tower, the majority of the viewshed consists of areas where the existing tower is currently visible. In certain locations, particularly to the southwest, the relocation of the tower will decrease visibility compared to current conditions. Using available street views which were verified during field survey, the APE-Architecture was further refined to only include resources directly or partially within the line of sight of the proposed new ATCT. The APE-Architecture does not include properties where the ATCT would only be visible from the tops of trees or from isolated areas on a building's roof. The resources located within the APE-Architecture generally consist of residences, commercial buildings, and industrial buildings, primarily constructed during the twentieth century.

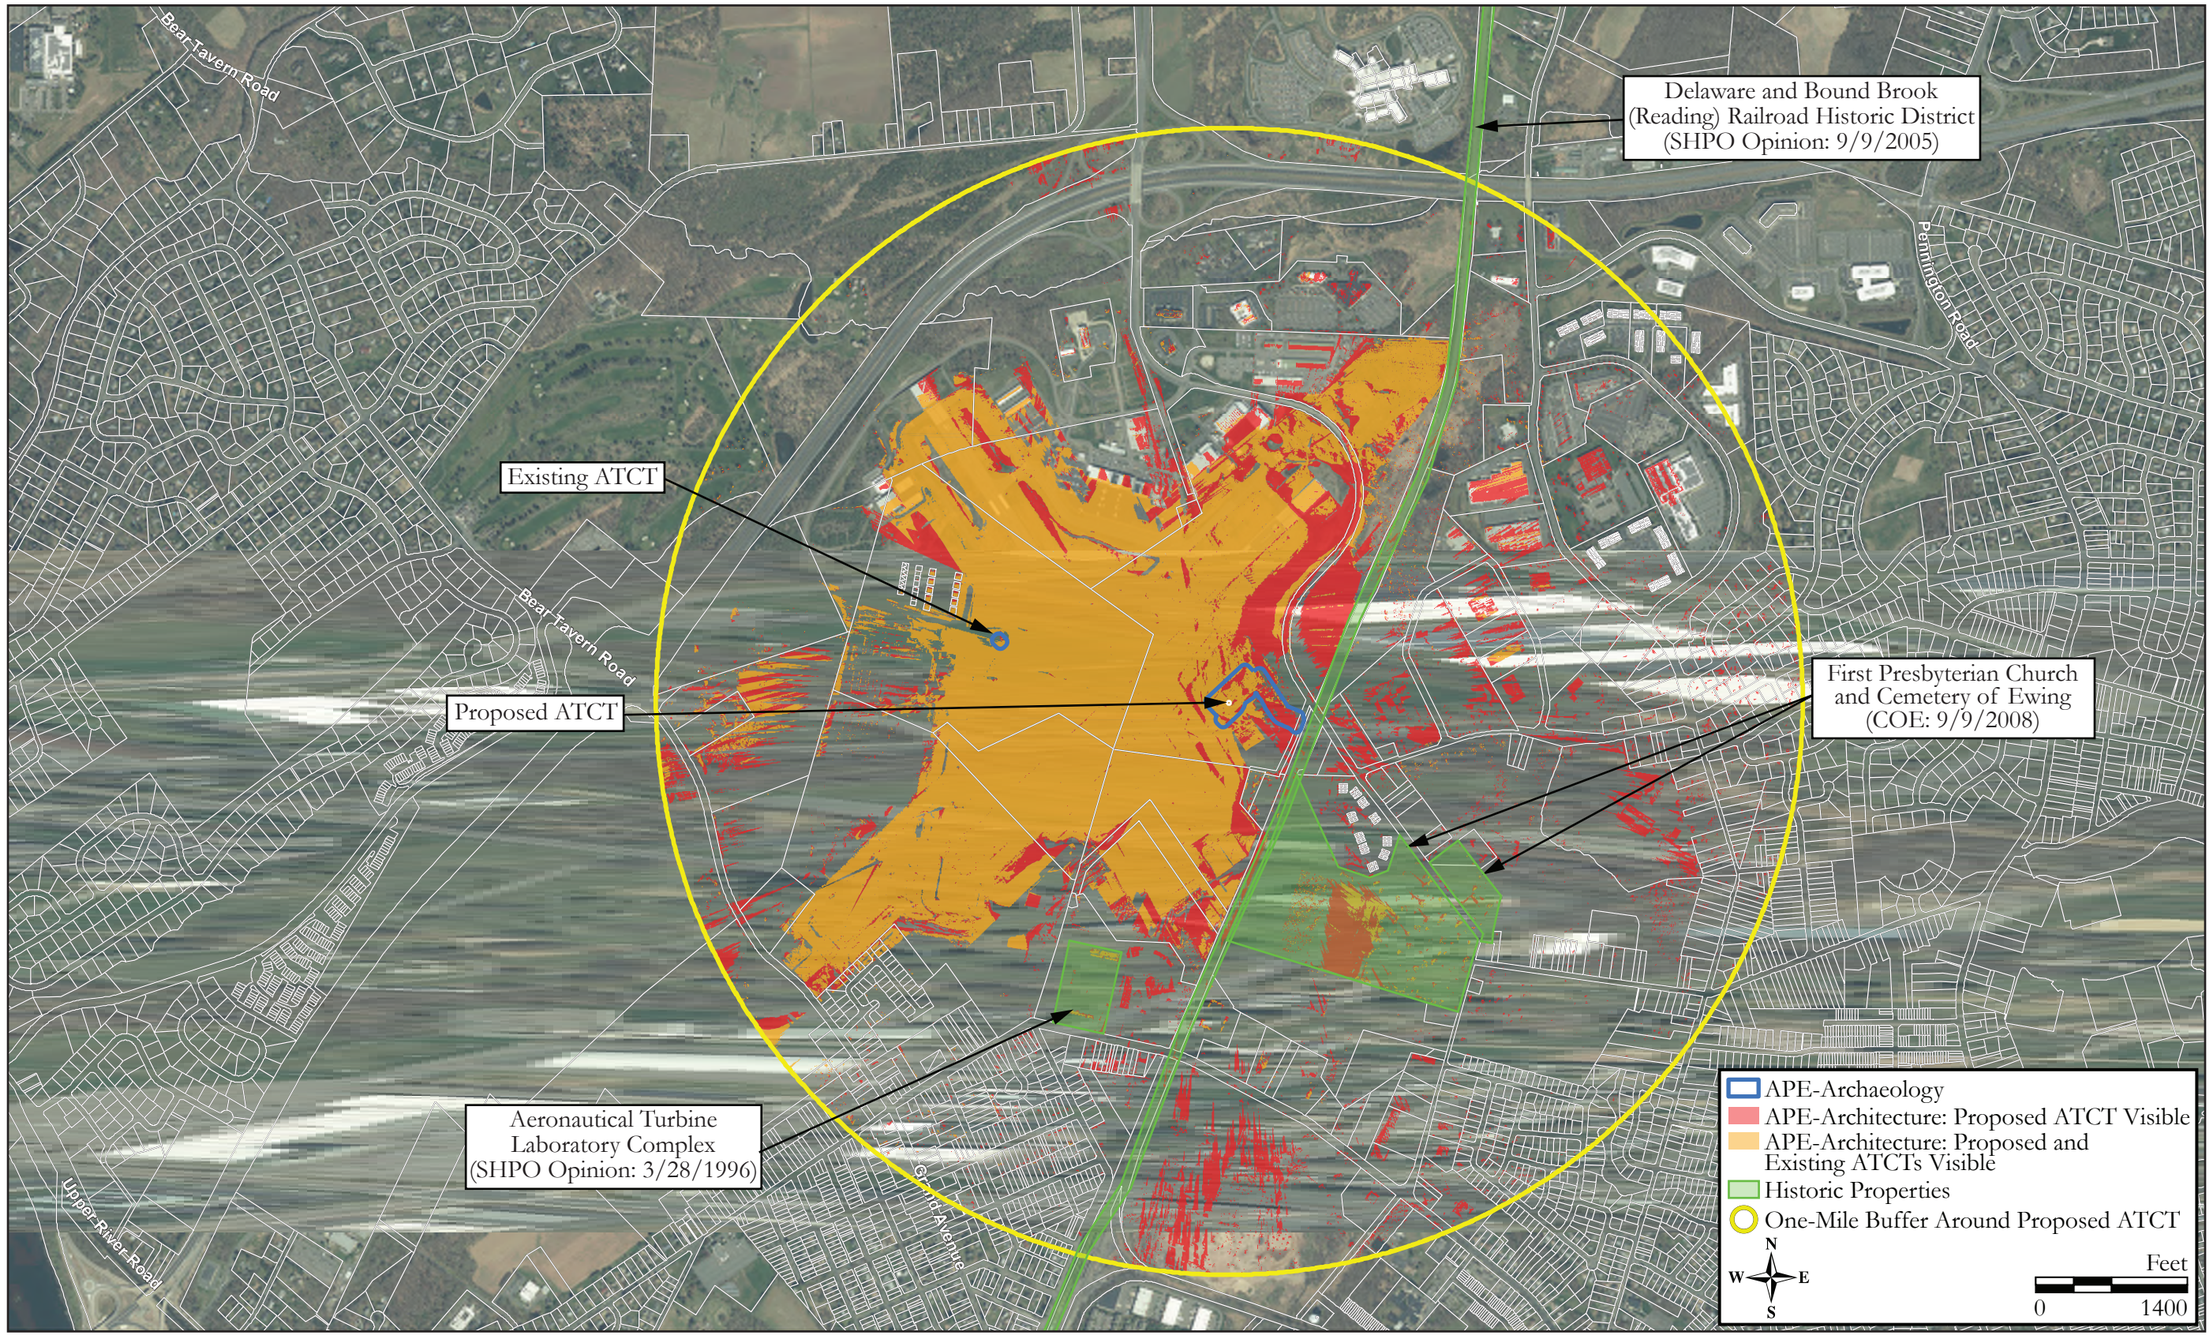

Figure 1.4: Aerial map showing the partially redacted APE-Archaeology and APE-Architecture (NJOGIS 2020).

2.0 PROJECT APPROACH

The purpose of this report is to present the results of a Phase IA historical and archaeological survey and Intensive-level historic architectural survey to initiate consultation with the NJHPO in compliance with the aforementioned regulations. The research design included an archaeological field reconnaissance with an assessment of archaeological sensitivity in the APE-Archaeology, and an Intensive-level historic architectural survey with an identification of architectural resources within the APE-Architecture.

2.1 Research Methods

Background research was conducted to determine if any documented archaeological resources were previously located within the APE-Archaeology and to determine if any documented historic resources exist within the APE-Architecture. A good faith effort was made to conduct NJHPO research by reviewing the New Jersey's Cultural Resources GIS Online Map Viewer (LUCY) and the updated list of historic properties to identify resources listed in or eligible for listing in the NRHP within or near the APE-Archaeology and APE-Architecture (NJDEP 2023). The list of cultural resources survey reports on the NJHPO's website was reviewed to identify prior surveys conducted nearby. Reports on file at the NJHPO documenting these surveys were reviewed when possible, as well as those housed in the RGA library. Site files at the New Jersey State Museum (NJSM) in Trenton were examined via electronic communication with Curator Dr. Gregory Lattanzi to identify the location of registered archaeological sites within or near the APE-Archaeology. Additional background research consisted of a review of pertinent primary and secondary sources, including historic maps and atlases, historic aerial photographs, newspaper articles, and local and county histories available online and in RGA's in-house library.

2.2 Archaeology

The purpose of the Phase IA historical and archaeological survey was to assess the sensitivity of the APE-Archaeology to contain unidentified archaeological resources and to make recommendations for further investigation (i.e., Phase IB survey), if warranted. The Phase IA historical and archaeological survey consisted of background research, consultation with interested parties, pedestrian reconnaissance, an assessment of archaeological sensitivity, and report preparation.

Survey methods comprised background research, a review of the environmental setting of the APE-Archaeology, development of pre-Contact and historic period contexts for the APE-Archaeology, a pedestrian reconnaissance to examine and document existing conditions, an assessment of pre-Contact and historic archaeological sensitivity, and management recommendations.

2.3 Historic Architecture

The goals of the Intensive-level historic architectural survey were to identify all resources in the APE-Architecture that are listed in or eligible for listing in the NRHP; to identify, survey, and evaluate the significance and integrity of previously unevaluated resources more than 50 years of age according to NRHP Criteria, and to assess the project's foreseeable effects on any listed or eligible resources in the APE-Architecture. Historic architectural survey fieldwork included a pedestrian survey of the APE-Architecture to allow for the identification and assessment of all above-ground architectural resources over 50 years of age. Newly identified resources were photographed and recorded on NJHPO Survey Forms with individual resource descriptions, historical contexts, and assessments of significance, integrity,

and NRHP eligibility in accordance with the NJHPO's *Guidelines for Architectural Survey* (Splain 1999). Two NRHP-eligible historic properties were resurveyed as part of this project in order to properly assess effects. Due to the limited information provided in the certificate of eligibility (COE) for the First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008), an NJHPO survey form was completed to better understand the historic significance of the property. A survey form was also completed for the Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996) as requested in NJHPO correspondence dated March 28, 1996 (Guzzo 1996). The NJHPO Survey Forms completed for this project are contained in Appendix E of this report. Project effects on any listed or eligible historic properties were assessed according to the NRHP Criteria of Adverse Effect (36 CFR 800.9) (see Appendix B).

2.4 Public Consultation

The views of the public are essential to informed decision-making pertaining to regulated activities; therefore, members of the public were informed about the project and given the opportunity to comment. Organizations and individuals with an identified interest in archaeology, history, and historic preservation were contacted. A record of correspondence with all individuals and organizations contacted during this survey along with any responses received is contained in Appendix D. If any responses arrive after the submission of this report, copies will be forwarded to DY Consultants, the FAA, and the NJHPO for consideration.

In addition to the aforementioned consultation, the FAA conducted government-to-government consultation with Native American Tribal Nations. The initiation of consultation letters with Tribal Nations are included in Appendix D.

The partially redacted version of the APE-Archaeology shape is illustrated on the consultation letter map.

3.0 BACKGROUND RESEARCH

Background research was conducted to locate previously identified archaeological and historic architectural resources in the vicinity of the project location and to assess the potential for previously unidentified cultural resources within appropriate cultural contexts. Research methods are described in Section 2.1.

3.1 Environmental Setting

The APE-Archaeology is located within the Piedmont Physiographic Province and is underlain by dolomitic or silty argillite, mudstone, sandstone, siltstone, and minor silty limestone of the Lockatong Formation (Figure 3.1; Owens et al. 1998; Wolfe 1977). Surficial sediments include Pleistocene-age weathered shale, mudstone, and siltstone (Newell et al. 2000). Soils mapped within the APE-Archaeology consist of moderately well-drained Udorthents, bedrock substratum with 0 to 8 percent slopes (UdbB) (Figure 3.2; NRCS 2021). Extensive ground leveling activities have taken place associated with the airport's construction since the mid-1940s.

The APE-Archaeology is located west of Scotch Road on a flat to moderately undulating topographic setting characterized as uplands, at an elevation ranging between 160 and 200 feet above mean sea level. The West Branch Shabakunk Creek adjoins the eastern boundary of the APE-Archaeology and is routed underground through a pipeline aqueduct. A 1940 aerial photograph does show a wooded portion of the branch just west of Scotch Road, adjacent to the APE-Archaeology, which was later modified and made into a lagoon between 1971 and 1979 (Nationwide Environmental Title Research [NETR] 1940, 1971, 1979). The West Branch flows into Shabakunk Creek 3.3 miles east of the APE-Archaeology, which subsequently flows into Assunpink Creek, the Delaware River, and eventually into the Atlantic Ocean. Vegetation and ground cover within the APE-Archaeology consists of manicured grass and asphalt-paved surfaces.

3.2 Pre-Contact Period Context

Archaeologists organize chronological and cultural information about the pre-Contact occupants of New Jersey and the Middle Atlantic region into three broad time periods: Paleoindian ±13,000–10,000 BP, Archaic 10,000–3000 BP, and Woodland 3000 BP–400 BP/ AD 1600 (Chesler 1982; Custer 1996; Grossman-Bailey 2001; Kraft 1986, 2001; Mounier 2003). These temporal periods serve as a chronological framework for the interpretation of archaeological data. The Archaic and Woodland periods are further subdivided into Early, Middle, and Late sub-periods. A section on the Pre-Clovis period has been included for additional context.

This chronology terminates at approximately AD 1600, marking roughly the initial contact between Native groups and Old-World populations, and is followed by a period of extensive colonization by the Dutch, Swedish, and English. These periods act as a general framework in order to study the approximately 13,000 years of human occupation in the area. It should be noted that studies of pre-Contact material culture and radiocarbon dates have increasingly determined that the above dates are approximations and do not represent definite or distinct chronological boundaries between material cultures associated with each pre-Contact period. Instead, temporal overlap between material culture styles suggest fluid rather than abrupt technological transitions over time and demonstrate that more radiometric dates are needed to better understand pre-Contact chronologies (Stewart 2018). Localized settlement pattern studies have helped to refine this Middle Atlantic pre-Contact chronology with reference to subsistence strategies and occupational patterns (Fitting 1979; Marcopul 2007; Mounier 1978; Pagoulatos and Walwer 1991; Wall et al. 1996). For each temporal period, environmental conditions, diagnostic artifacts, and cultural characteristics are briefly summarized.

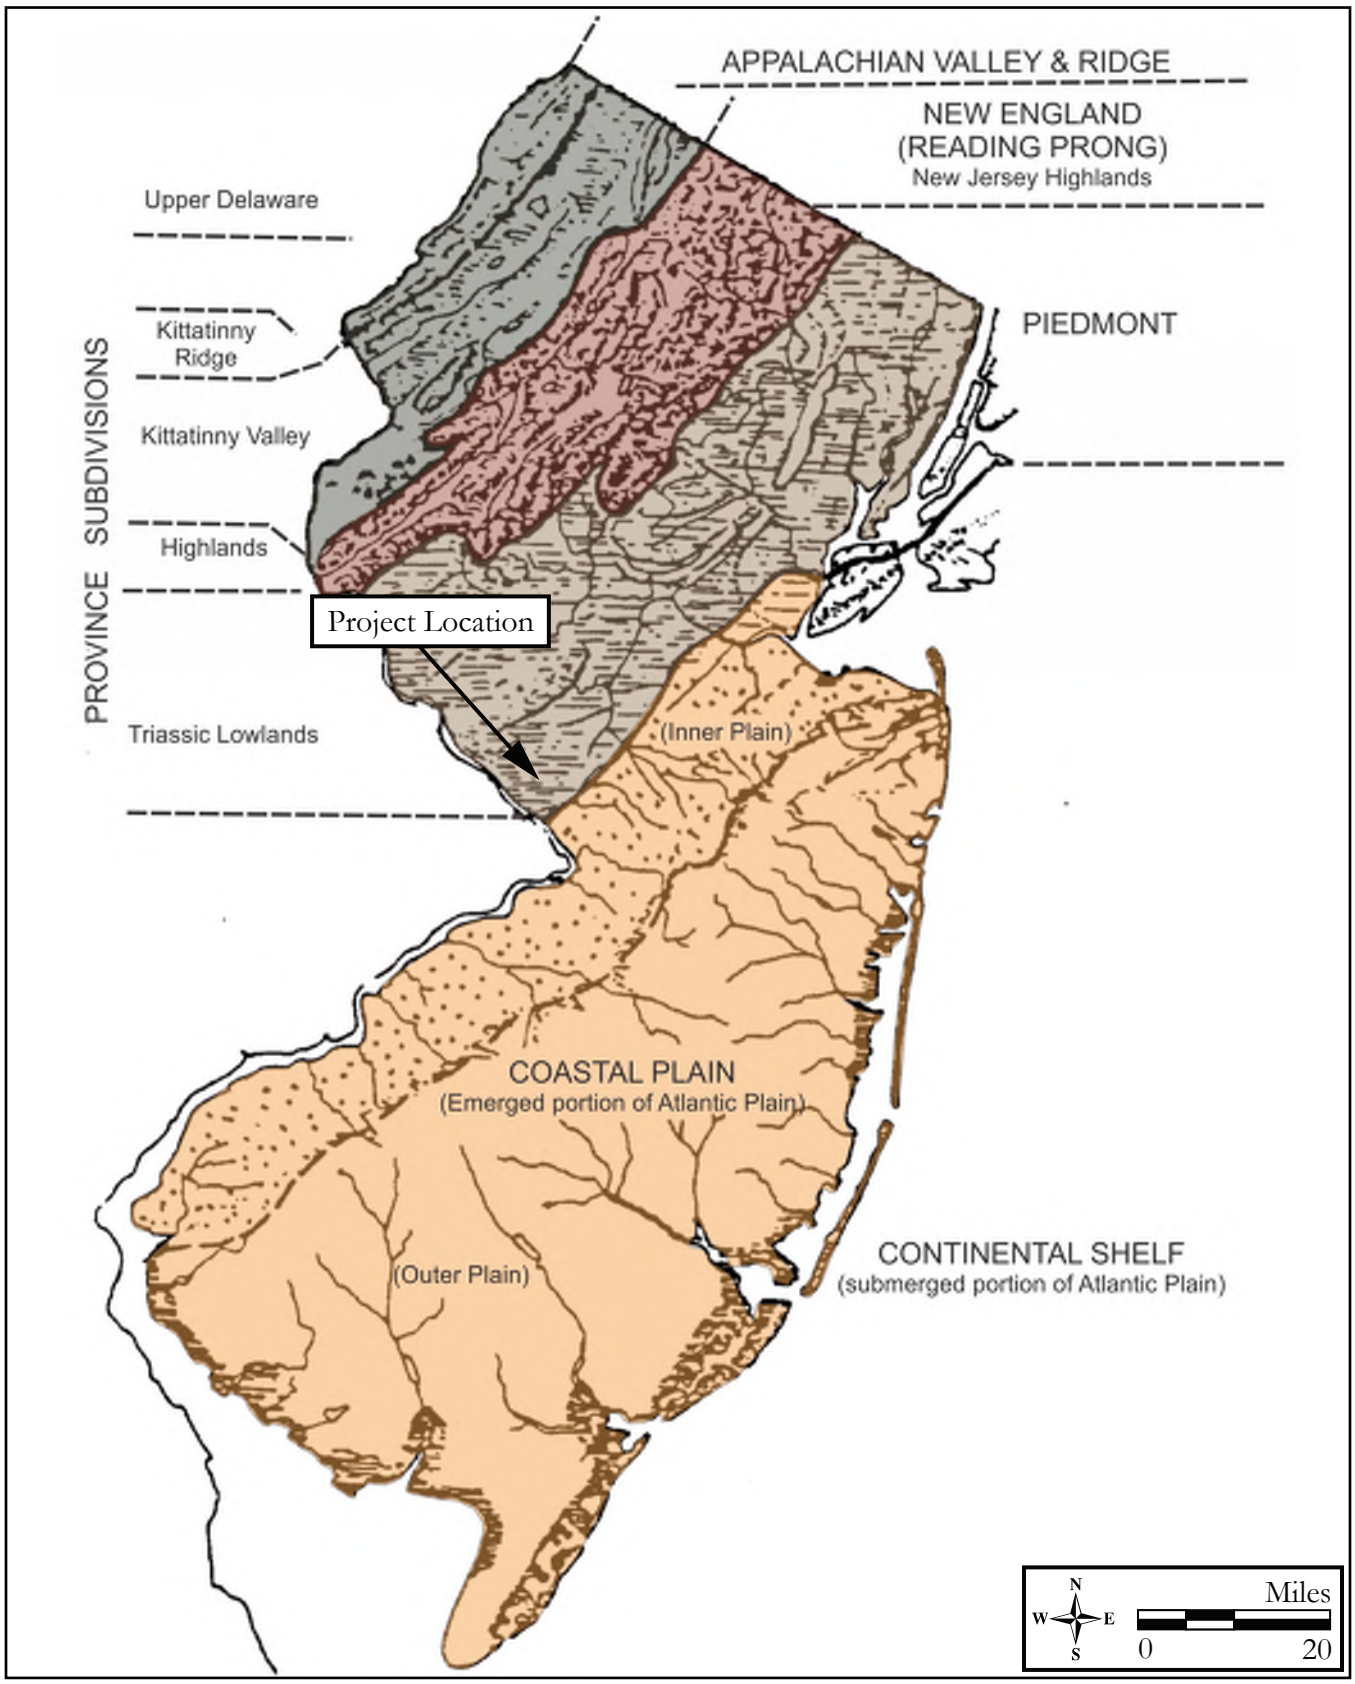

Figure 3.1: Physiographic provinces map
(adapted from Wolfe 1977).

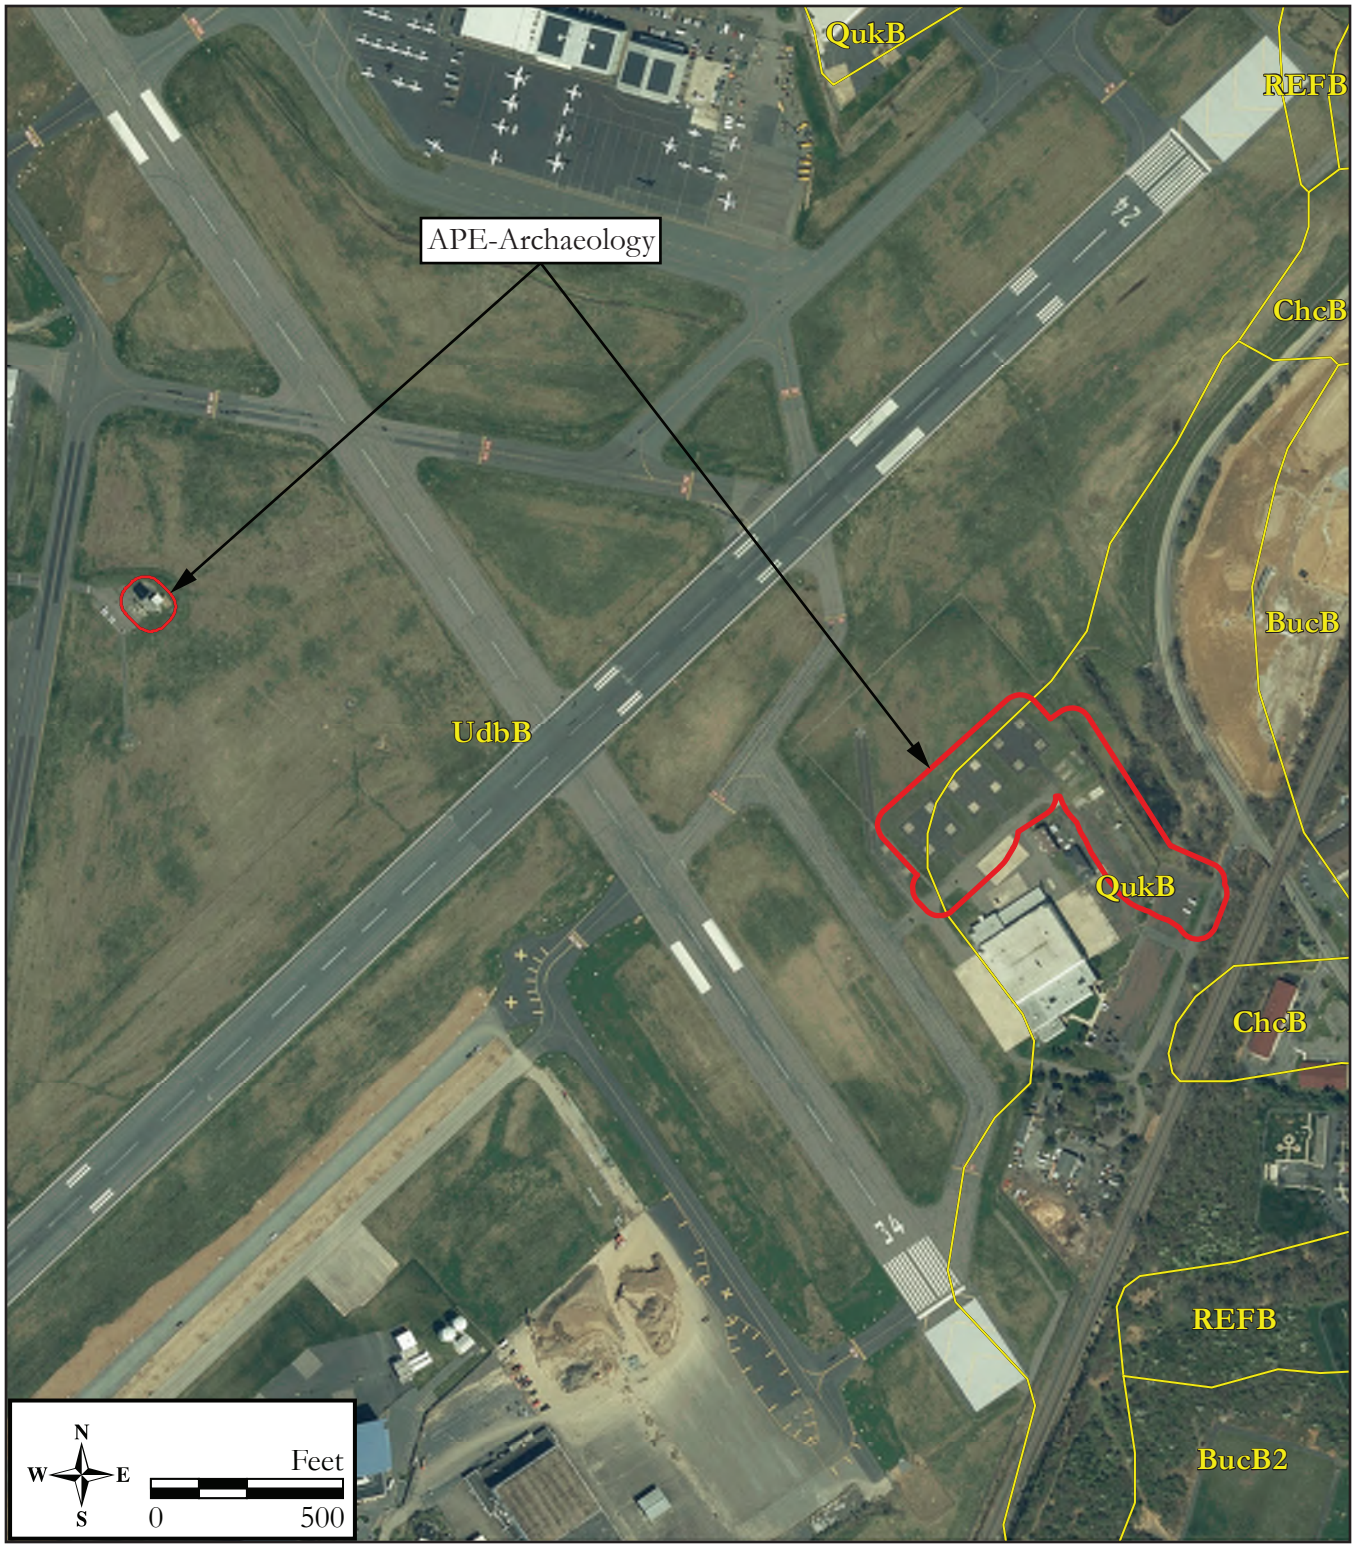

Figure 3.2: Soils map showing the partially redacted APE-Archaeology
(2021 Soil Survey Staff, Natural Resource Conservation Service, United States Department of Agriculture. Soil Survey Geographic [SSURGO]).

Pre-Clovis Period (circa 16,500 BP–±13,000 BP)

There is increasing evidence for earlier (Pre-Clovis) occupation in the Americas (Carr 2018; Miller and Gingerich 2013), including Monte Verde in Chile (Dillehay 2000), Meadowcroft Rockshelter in Pennsylvania (Adovasio et al. 1990), Miles Point in Maryland (Carr 2018), Cactus Hill in Virginia (MacPhail and McAvoy 2008; McAvoy and McAvoy 1997; Wagner and McAvoy 2004), and Topper in South Carolina (Goodyear 2005). Pre-Clovis sites include a technology consisting of flake tools, small bifacial projectile points, blade-like or elongated flakes, and use of retouched or utilized flakes (Carr 2018). No Pre-Clovis sites have been identified in New Jersey.

Paleoindian Period (±13,000–10,000 BP)

The Paleoindian period represents the initial occupation of the Northeast following deglaciation. Major coastal plain landscape features likely influenced the occupational patterns of Paleoindian groups, including interior wetlands, periglacial features, cuestas, low terraces, deep river channels, estuaries, and dendritic drainages formed from glacial melt (Grumet 1990; Kraft 1986, 2001; Marshall 1982; Pagoulatos 1998). Areas of tundra, spruce, pine, and deciduous vegetation occupied microniches across New Jersey, influencing faunal patterns (Kraft 2001; Marshall 1982). Early Paleoindian inhabitants likely hunted large and small game, and supplemented their diet with collected wild plants, nuts, and aquatic resources (Carr and Adovasio 2002; Custer and Stewart 1990; Dent 1991; Gingerich 2011; Marshall 1982). Evidence from the Shawnee-Minisink Site in the Upper Delaware Valley, for instance, suggests a subsistence regime whereby fishing and plant foraging, including hawthorn plum, berries, and hickory nut, supplemented game hunting (Gingerich 2011; Stewart 2007). Paleoindians were likely organized as highly mobile bands, and sites dating to this period often consist of small encampments. Relatively few Paleoindian sites have been documented in the New Jersey Piedmont (Pagoulatos 2004:130). Two well-documented Paleoindian sites in northern New Jersey, the Plenge and Zierdt sites, are open-air sites located on terraces along the Musconetcong and Delaware rivers, respectively (Gingerich 2013; Kraft 1973; Werner 1964). The Dutchess Quarry Cave site in Orange County, New York, however, suggests that rock shelters and caves were also used by Paleoindians (Funk 1976; Kopper et al. 1980). Toolkits recovered from sites often include fluted projectile points, scrapers, flake tools, and debitage.

Early Archaic Period (10,000–8500 BP)

The lifeways of Early Archaic period peoples were likely similar to those during the end of the Paleoindian period, as this transition was not marked by a punctuated change, but rather a variety of small, gradual adjustments over time (Adovasio and Carr 2009). Environmental conditions in northern New Jersey during this period included a cool climate and a mix of areas containing boreal and mast-bearing deciduous vegetation (Raber et al. 1998; Sirkin 1977). Evidence for Early Archaic occupation in northern New Jersey suggests that small, mobile bands seasonally exploited resources in riverine and coastal areas, including floodplains and river islands (Dumont and Dumont 1979; Kraft and Mounier 1982). Early Archaic diagnostic artifacts include stemmed and notched points, chipped stone choppers, and hammerstones. New tool forms suggesting adaptations to exploit forest resources, such as grinding slabs, milling stones, and pitted cobbles, have been found in Early Archaic contexts (Custer 1996). Early Archaic diagnostic notched and stemmed projectile point forms consist of Amos, Palmer, Charleston, Lost Lake, Decatur, Fort/Nottoway/Thebes, and Kirk types (Kraft 2001; Stewart 2018). Radiocarbon dates are documented for limited Kirk point types in the Upper Delaware Valley and range between 9000 and 8000 BP, including at the Harry's Farm and Rockelein sites in the Upper Delaware Valley (Stewart 2018).

Middle Archaic Period (8500–5000 BP)

Ongoing environmental change in the Middle Atlantic region increased deciduous, mast-producing vegetation, which offered additional food resources (Custer 1989; Kraft 2001). These changes coincide with an apparent population increase during the Middle Archaic period in New Jersey, though social groups were still limited in size. Occupation of riverine and stream settings continued with increased exploitation of estuarine settings and deciduous wooded uplands (Carr and Moeller 2015:87; Kraft 2001; Kraft and Mounier 1982). Evidence suggests decreased settlement mobility during the Middle Archaic, a departure from Paleoindian and Early Archaic lifeways. By the end of the Middle Archaic,

toolkits included woodworking tools, including axes, adzes, and gouges, manufactured through pecking and grinding of durable metamorphic and sedimentary stones. These implements could be used in felling trees and hollowing logs for canoes (Custer 1996; Kraft 2001). Middle Archaic diagnostic bifurcate projectile points are classified as MacCorkle, St. Albans, and LeCroy. Certain Kirk forms date to the Middle Archaic period. Other distinctively Middle Archaic diagnostic types include Neville and Stanly projectile points with shallow basal notching (Custer 2001:45). New lithic sources were sought and quarried, including argillite and shale from north-central New Jersey and Cohansey quartzite from southern New Jersey (Grossman-Bailey 2001:211–223; Kraft and Mounier 1982). Various types of notched, bifurcate-base, and stemmed projectile points were used to tip spears for hunting, sometimes used in a stone-weighted atlatl.

Late Archaic Period (5000–3000 BP)

The Late Archaic is characterized by adaptation to a more temperate climate, stabilized sea levels, and tidal conditions along the region's large rivers and streams (Kraft and Mounier 1982; Ritchie 1965). The beginning of the Late Archaic period roughly corresponds to the late middle Holocene warm, dry Sub-Boreal period (Carr and Moeller 2015; Stewart 2018). An increase in the number and size of sites during this period suggests a greater population, likely due to environmental changes which offered an increased food supply (Custer 1996; Kraft 2001; Kraft and Mounier 1982). Other major cultural developments during this period include the growth and expansion of long-distance trade networks and increased sedentism. Decreased social group mobility may have resulted in territorialization, spurring the development of trade networks (Kraft and Mounier 1982; Pagoulatos 1998; Stewart 1989). Larger Late Archaic sites were typically located in resource-rich areas along major rivers, with smaller campsites, procurement stations, transient camps, and isolated activity areas in a variety of settings (Custer 1984; Kraft 2001). Mortuary ceremonialism has also been documented for the Late Archaic period, as evidenced by such sites as Savich Farm and Koens-Crispin (Cross 1941; Hawkes and Linton 1916; Regensburg 1971).

In addition to material types discussed previously, a number of additional tools emerged or became more common on Late Archaic sites, including mortars, milling stones, pestles, nutting stones, sinew stones, shaft smoothers, atlatl weights, and plummets (Kraft 2001). During the latter portion of the Late Archaic, vessels carved from steatite (with sources in Pennsylvania and New England) emerged for food preparation (Kraft 2001). Argillite exploitation and use increased substantially during the Late Archaic (Stewart 1989, 1994). A variety of notched and stemmed projectile points (i.e., Bare Island, Brewerton, Lackawaxen, Lamoka, Macpherson, Normanskill, Pequea, Piney Island, and Poplar Island) were used throughout this period, and new forms were introduced, including broadspear (Susquehanna, Savannah River, Snook Kill, Lehigh/Koens-Crispin, and Perkiomen) and fishtail types (Custer 2001; Stewart 2018).

Early Woodland Period (3000–2500 BP)

Many Late Archaic lifeways continued into the Early Woodland period. Defining a clear temporal boundary between these periods is problematic due to the increasing number of radiocarbon dates associated with diagnostic artifacts such as early ceramics, steatite vessels, and fishtail points (Carr and Moeller 2015:107; Stewart 2003:5, 2011, 2018). The occupational model for the Early Woodland suggests seasonal aggregation of social groups in semi-sedentary, riverine base camps, with cyclical movements to satellite encampments and procurement areas in interior settings (Custer 1996; Hummer 1994; Kraft 2001; Mounier 1978; Williams and Thomas 1982). Early Woodland peoples exploited plant foods associated with the Eastern Agricultural Complex, including sunflower, squash, little barley, knotweed, and Chenopodium (Carr and Moeller 2015; Messner 2011:30–31). Archaeologists have posited the emergence of a number of distinct cultural complexes during the Early and Middle Woodland periods (i.e., Orient, Meadowood, Middlesex, etc.). These cultures are distinguished by projectile point and ceramic morphologies, subsistence practices, ornamental and ceremonial artifacts, and burial ceremonialism. The practices and material culture of some of these complexes suggest an Ohio Valley influence (Bello et al. 1997; Custer 1996; Kraft 2001; Lowery 2012; Mounier 1981; Stewart 1989). Early Woodland diagnostic artifacts include Meadowood/Hellgrammite projectile points, teardrop bifaces, Adena material, and early ceramic types (Carr and Moeller 2015; Custer 1996,

2001; Stewart 2003, 2018). Ceramic types typically associated with the Early Woodland period include Marcey Creek and Vinette I (Stewart 1998a, 2018). Side-notched and stemmed projectile point types used during earlier periods continued to be manufactured and utilized during the Early Woodland.

Middle Woodland Period (2500–1200 BP)

The Middle Woodland period saw continued estuarine and tidal habitat development as slow sea level rise continued (Grossman-Bailey 2001). Developments during this period included early experimentation with horticulture and innovation and refinement of ceramic technology (Custer 1996:217; Hart 2008; Stewart 2003). Exchange networks and mortuary customs continued, but also took new forms (Kraft 2001; Lowery 2012). Populations increasingly exploited anadromous fish, shellfish, and incorporated seed crops into subsistence regimes (Hart 2008; Mounier 2003; Schindler 2006; Stewart 1999). Material diagnostic of the Middle Woodland includes Fox Creek and Jack's Reef projectile points, as well as interior-marked and crisscross cord-marked pottery (Custer 1996; Harris 2007; Stewart 1998a, 2003; Walker 2013). Middle Woodland ceramic innovations included coil-constructed pottery and net-marking surface treatment, both of which were common by the end of this period (Stewart 1998a). Evidence from the Abbott Farm Complex suggests a Middle Woodland settlement model based on seasonal aggregation and dispersal of social groups across relatively large territories. Social groups aggregated seasonally in larger semi-sedentary base camps supplied by outlying transient/procurement camps, hunting stations, and specialized encampments, dispersing later in the year to better exploit environmental resources (Wall et al. 1996).

Late Woodland Period (1200–circa 400 BP)

The Late Woodland period saw a shift in social organization and settlement patterns whereby semi-sedentary occupations within more restricted territories became common (Custer 1996; Kraft 2001; Stewart 1998b). Such changes were evidenced by the circumscribed distribution of certain pottery styles and a greater focus on local lithic resources (Custer 1996; Kraft 2001; Stewart 1987). Larger Late Woodland occupations were frequently sited on floodplains (Stewart 1991). Throughout much of the Middle Atlantic region, the Late Woodland period saw an increasing reliance on horticulture as part of the subsistence regime as plants including maize, beans, and squash were cultivated (Carr and Moeller 2015; Custer 1996; Messner 2011; Stewart 1995, 1998b). Technological changes include the use of small, triangular projectile points with the bow and arrow and the development of complex, often locally specific ceramic designs and decorative motifs (Kraft 2001; Stewart et al. 1986).

The Raritan River is sometimes defined as the boundary between proto-Unami Delaware speakers to the south and the proto-Munsee Delaware to the north. The Unami Delaware who occupied central and southern New Jersey may have interacted with other coastal groups who occupied the Delmarva Peninsula, as well as the Munsee Delaware in northern New Jersey, based on the distribution of ceramics and other artifacts (Kraft 2001; Stewart 1998b). Based on seventeenth-century ethnohistoric accounts, these linguistically related groups may have had organized polities that controlled, among other things, oystering and hunting territories during the Late Woodland and proto-historic periods (Goddard 1978:215). Shellfish gathering occurred in the spring and summer months from smaller camps and the meats were dried for later use (Goddard 1978:216–217). The restricted distribution of pottery styles and the focus on the utilization of local lithic sources along with ethnohistorical data suggest a greater degree of territoriality in the Late Woodland period than in the preceding periods (Custer 1996; Kraft 2001). The Late Woodland period terminates at the arbitrary date coinciding with contact between Late Woodland Native American populations and European explorers and colonists.

The Contact Period (circa 400–250 BP [AD 1750])

The Contact period describes the period of European exploration of the Atlantic coastline and near interior, during which early interactions began between the native inhabitants of New Jersey and Europeans. Most historians credit Giovanni da Verrazzano and Henry Hudson with initiating contact with the Lenni-Lenape and other native groups of the Northeast (Kraft 2001). Cornelius van Tienhoven traveled through the Raritan Valley in 1639, encountering a fertile floodplain that was not continuously occupied, but was well-traveled by Native American groups (Brahms 1998:22). Comparable to earlier periods, the effects and timing of these interactions vary significantly throughout the region. In New

Jersey, early European traders and fishermen made sporadic contact with Native Americans; however, the effects of these early interactions are still not understood. Mounier (2003:24) notes that prior to European settlement, there appears to have been a Native American population collapse on the coast, which may have been caused by diseases introduced during early trading interactions, combined with group decisions to relocate as incidents of conflict increased. During the seventeenth and eighteenth centuries, Native American villages, occupations, and interactions, peaceful and otherwise, were documented in early historic records (Brahms 1998; Goddard 1978; Grumet 1990; Kraft 1986, 2001; Snell 1881). In the vicinity of the APE-Archaeology, Native Americans continued to interact with Europeans on various levels, continuing aspects of their traditional lifeways while assimilating with the new society. Dutch and English colonists initially occupied the area for commercial reasons associated with the fur trade, as the Raritan and Millstone rivers were important travel routes and seasonally occupied by Native American groups who used the fish and shellfish resources of tidal marshes around Raritan Bay. The fertile land of the Raritan drainage quickly drew additional Dutch and English settlers. By the beginning of the eighteenth century, most Lenape had left the Raritan River Valley due to pressures from Euro-American settlers, disease, and conflict with the Iroquois to the north.

Contact period sites are rare. Williams and Kardas (1982:185) point out that by the early 1600s the Contact period is more recognizable in the archaeological record due to European settlement and the establishment of trading posts. The first colonial settlements in coastal central New Jersey were established in the mid-seventeenth century, and documentary evidence indicates that Native American settlements at the time were situated in many of the areas sought after by settlers, including along major river drainages and bays that emptied into the Atlantic Ocean, such as the Delaware River drainage (Williams and Kardas 1982).

Local Pre-Contact Context

In conjunction with the Scudder Falls Bridge replacement project, the Delaware River Joint Toll Bridge Commission conducted two archaeological data recoveries at pre-Contact period Native American sites located on both sides of the river (AECOM 2012a, 2012b). The nearest to the APE-Archaeology, the Reeders Creek West Site (28-Me-360), is situated 1.6 miles southwest of the APE-Archaeology in Ewing Township (AECOM 2012a). Completed in 2012, the archaeological data recovery yielded 15,898 pre-Contact Native American artifacts and documented occupations spanning from the Late Archaic to the Late Woodland periods (AECOM 2012a). It was determined that the Reeders Creek West Site likely functioned as a resource procurement and processing station occupied on a seasonal basis. Both macro-band and micro-band site types would have been established by the Lenape on broad Delaware River terraces to engage in foraging and hunting activities (AECOM 2012a). In Lower Makefield Township, Bucks County, Pennsylvania, the River Road Site (36-Bu-379) yielded 9 pre-Contact features and 3,397 artifacts dating to the Late Archaic and Late Woodland periods (AECOM 2012b). Located approximately 1.9 miles southwest of the APE-Archaeology, the River Road Site is a macro-band base camp with a hearth and cache feature. Smaller, micro-band camps were situated in a low swale west of a terrace bordering the Delaware River and contained a buried A-horizon revealing a living surface with evidence for the use of maize and tobacco (AECOM 2012b).

The Abbott Farm Archaeology Historic Landmark or Trenton Complex, located approximately 5 miles southeast of the APE-Archaeology, includes well-documented sites that represent a series of upland bluff edge and floodplain sites within the Delaware River drainage occupied from the Middle to Late Archaic to the Late Woodland periods. The Trenton Complex sites provide significant information to interpret sites throughout the Piedmont and Coastal Plains. Sites of the Trenton Complex contained numerous features and intact subsoils and yielded a wide variety of diagnostic materials, as well as organic remains used for radiocarbon dating. Based on the results of work at the Trenton Complex and in central New Jersey, Wall et al. (1996) postulate a regional settlement model consisting of four main site types: macro-social unit camps, transient camps (or procurement and processing camps), stations, and specialized camps. Macro-social unit camps are large sites found at high terraces along streams or floodplains at inland locations. Transient camps are sites located on streams or marshes that were used for a short period of time for the manufacture and maintenance of tools and for food

and resource procurement and preparation. Stations are sites used by specialized task groups for very short-term hunting activities. Wall et al. (1996:110) proposed that "populations exploited relatively large territories through seasonal aggregation and dispersal, depending on the distribution and abundance of resources." Macro-social unit camps were located at high terrace bluffs and along floodplains from early spring to late summer near the Delaware River, and from fall to winter, settlements were moved inland possibly to the Piedmont region. Transient camps and non-sedentary site types supplied the base camp with necessary resources, such as game animals, lithic materials, fish, and other materials. The model is based on seasonal migration and social groups that divide and reunite to better exploit the environment while maintaining social and cultural ties.

3.3 Historic Context

Due to the varying scales on historic maps and because existing landmarks are not always accurately represented, the term project location is used within this section and on some historic map figures.

The project location lies within Ewing Township, in a section often referred to as West Trenton due to its proximity to the city. Ewing Township was formed from Trenton Township in Hunterdon County in 1834 and was among the lands incorporated into Mercer County four years later, in 1838. Mercer County underwent several more boundary changes and settled on its current configuration in 1845. Ewing Township's current boundaries were established in 1900 (Snyder 1969:161–162).

Prior to the turn of the eighteenth century, there were very few colonial settlers north of present-day Trenton. Andrew Smith, who settled in what is now Ewing Township, was one of the first to establish himself in the area as a yeoman farmer on 200 acres of land prior to 1688 (Hunter and Porter 1990:25). Most of the European settlers who purchased land and settled near the project location in the eighteenth century were English families who relocated to the area from earlier colonial settlements in Long Island, East Jersey, and New England. These families were largely Presbyterian and Baptist, although there were also a small number of Quakers (Hunter and Porter 1990:26). Bear Tavern Road, located approximately 3,00 feet west of the project location and originally known as the Great Road, was one of the first transportation routes in the area, built circa 1700 (Hunter and Porter 1990:169; John Milner Associates, Inc. 2010:25). As the eighteenth century progressed, the local population grew, demand for farmland increased, and more uninhabited land was cleared and cultivated. This in turn fueled the construction of additional roadways to connect the new settlers with established settlements and markets (Hunter and Porter 1990:26).

During the Revolutionary War, roadways in and around the project location, including Bear Tavern Road, were used by military forces (Figure 3.3; Faden 1777; Munn 1976). The developed places closest to the project location in the late eighteenth century were Pennington (approximately 3 miles to the north) and Trenton (approximately 4 miles to the southeast) (Figure 3.4; Hills 1781). Bear Tavern Road served as a thoroughfare between present-day Titusville and Trenton, which were active hubs for troop movements prior to and after the Battle of Trenton in 1776 and the Battle of Assunpink Creek in 1777 (John Milner Associates, Inc. 2009; Munn 1976). General George Washington's crossing of the Delaware River occurred approximately 3 miles northwest of the project location. Approximately "1,500 men and 10 pieces of cannon" traversed present-day Bear Tavern Road under Major General Sullivan and General Green (see Figure 3.4; Faden 1777). No structures were mapped within or proximate to the project location in the late eighteenth century (Faden 1777; Hills 1781).

In 1833, Scotch Road had been established and the nearest mapped mill or manufactory to the project location was situated approximately 1 mile to the northeast in present-day Hopewell Township along a tributary of Jacob's Creek (Figure 3.5; Gordon 1833). Gordon's 1833 map depicts the old footprint of Scotch Road intersecting with a road proceeding east from Birmingham. This road was the predecessor of present-day Upper Ferry Road, and the project location lies directly north of this intersection.

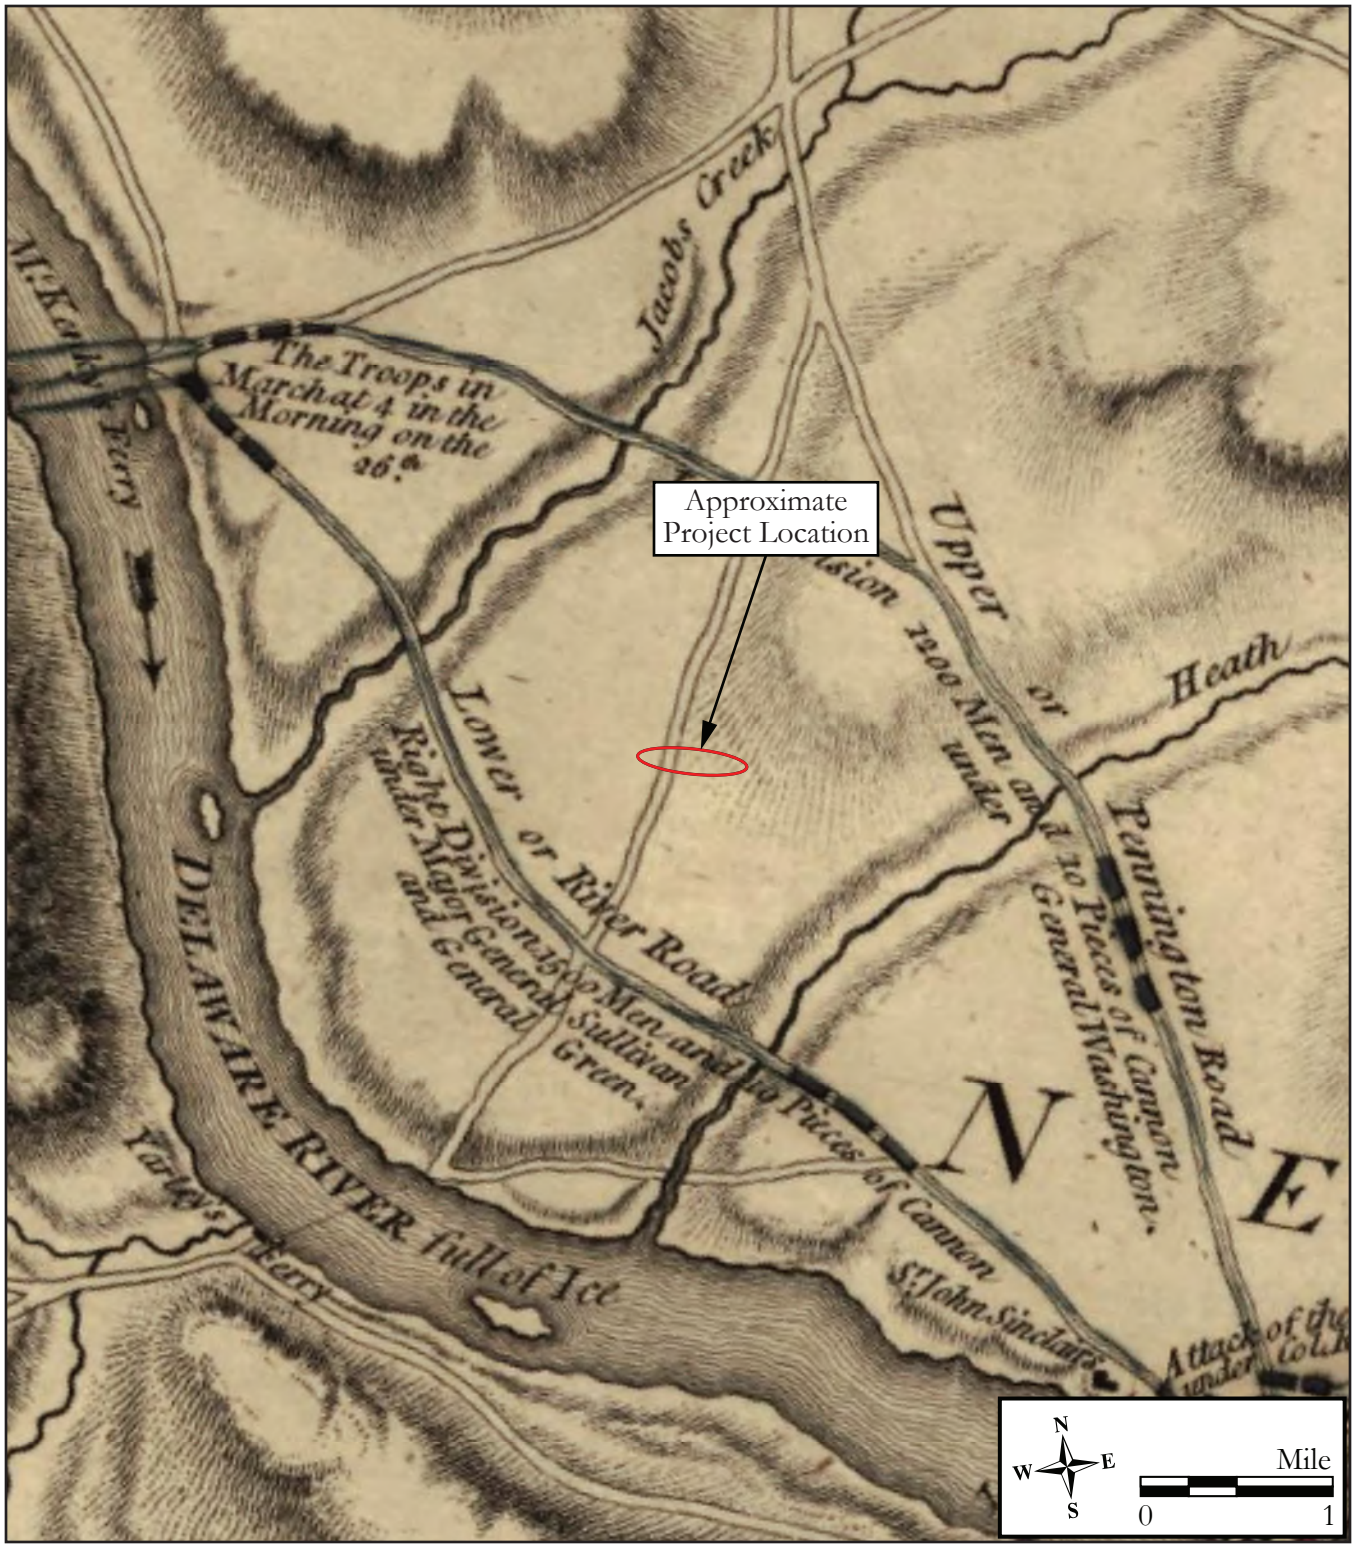

Figure 3.3: 1777 William Faden, *Plan of the Operations of General Washington, against the Kings Troops in New Jersey, from 26th of December, 1776, to the 3rd January 1777.*

Figure 3.4: 1781 John Hills, *A Sketch of the Northern Parts of New Jersey.*

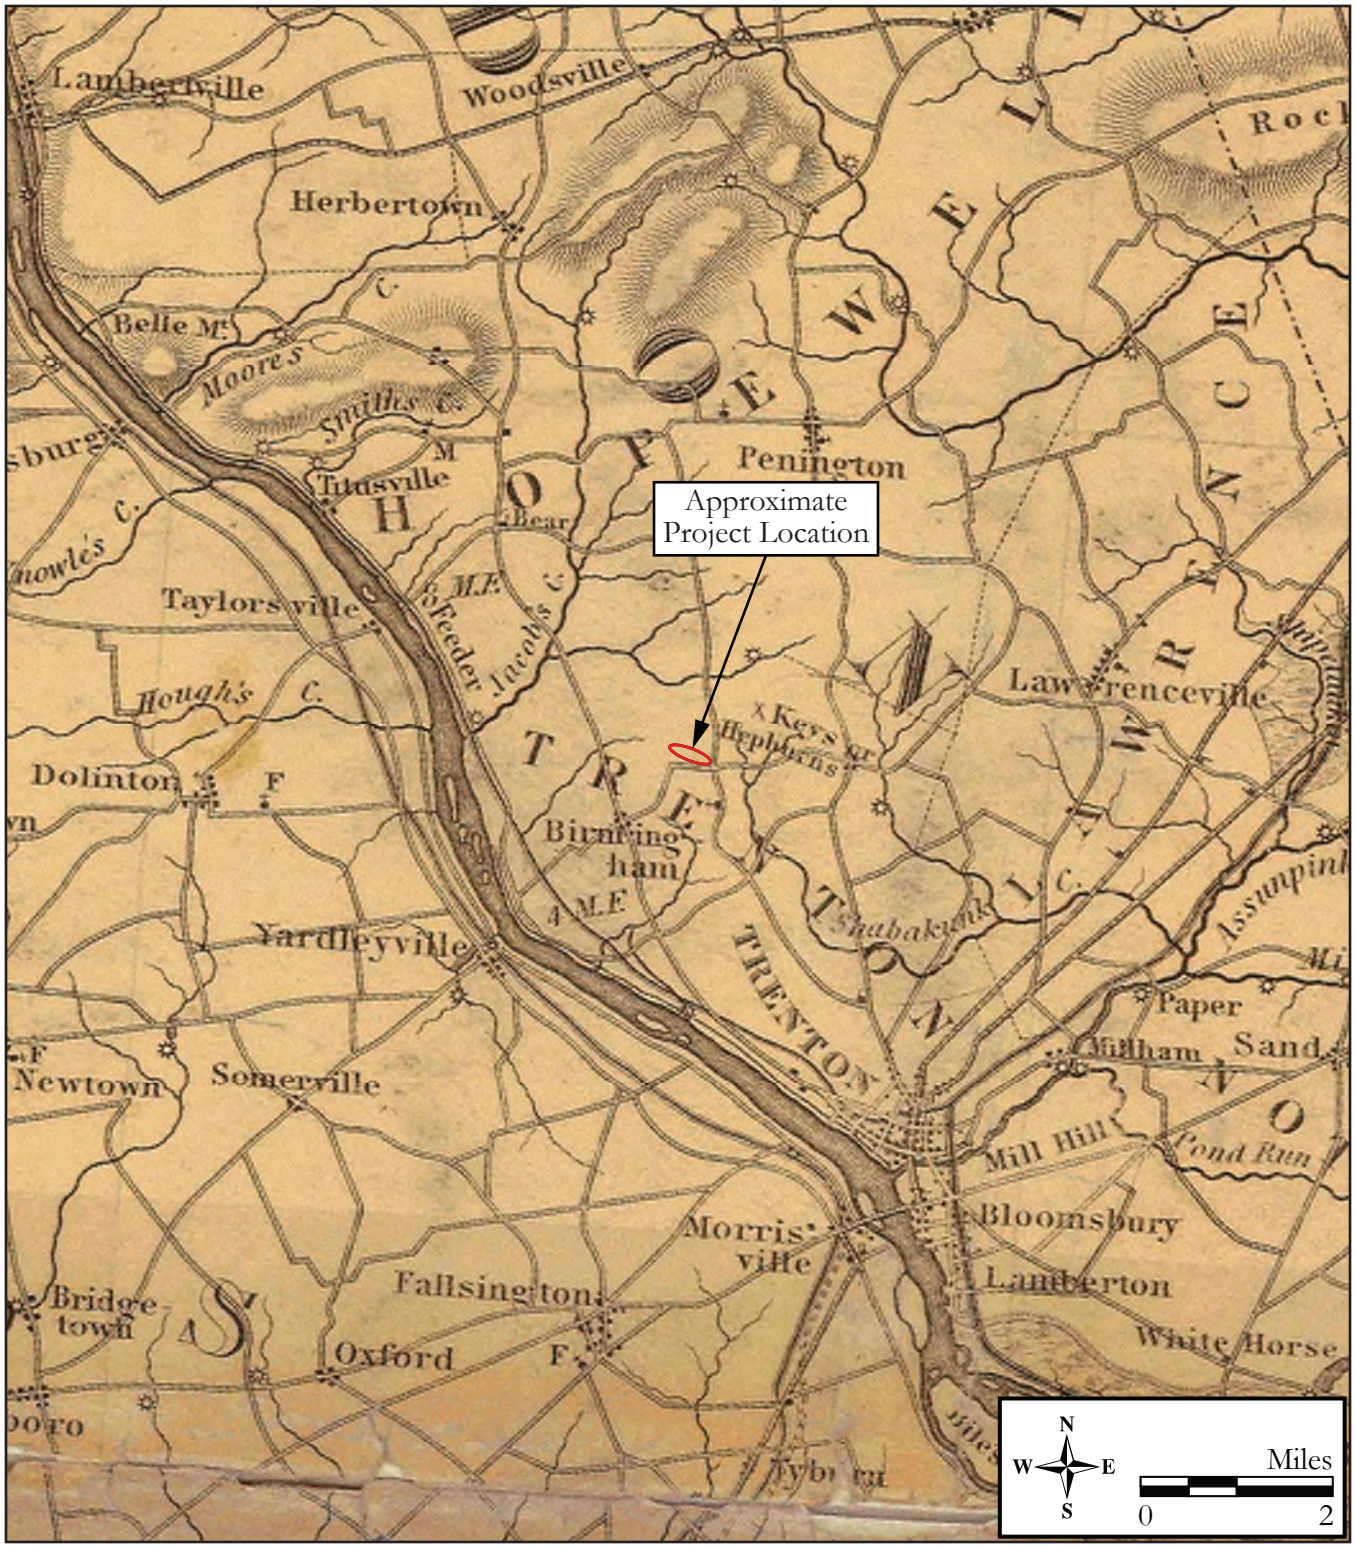

Figure 3.5: 1833 Thomas Gordon, *A Map of the State of New Jersey with part of the adjoining States.*

In 1849, several dwellings were mapped in the vicinity of the project location (Figure 3.6; Otley and Keily 1849). These include the residences of O. Howell and a map-documented building with an unattributed owner southeast of the William McIlvane residence. The O. Howell residence stood 540 feet to the west of the project location and the house with the unattributed owner stood 130 feet to the east and was separated from the project location by a tributary. McIlvaine, who owned a house that stood 475 feet north of the project location, was a judge of the Court of Common Pleas in Mercer County for 15 years (Woodward and Hageman 1883:790).

By the last quarter of the nineteenth century, the population had increased along Bear Tavern Road and Scotch Road, and the Delaware and Bound Brook Railroad (D&BBRR) had been constructed directly southeast of the project location in the vicinity of Scotch Road (Figure 3.7; Everts & Stewart 1875). The McIlvaine residence, then owned by Edward Shippen McIlvaine, William's son, is mapped 475 feet north of the project location and an unattributed building stood 130 feet east of the project location on the opposite side of a tributary (Woodward and Hageman 1883:790). The L. Ivens' house, formerly owned by O. Howell, is mis-plotted on the map and stood 540 feet west of the project location. The Ivens family was a noted family in Hamilton Township (Woodward and Hageman 1883:798). The area southwest of the project location east of the railroad contains a dwelling owned by McIlvaine and a wheelwright machine shop. An area north of the project location belonged to the Vernam family (see Figure 3.7).

By 1890, the project location is mapped within the properties of "Howard McIlvain," likely a descendant of William and property owned by "Alex L. Ivans" (Figure 3.8; Scarlett and Scarlett 1890). To the north is a parcel owned by "Jno Vernam" and to the south is a tract owned by "Jno Coleman." The Ewing Railway Station and two other structures are mapped in the southern vicinity of the project location, which otherwise retained much of its rural character by the beginning of the twentieth century (Figure 3.9; USGS 1906; NETR 1931, 1940). A 1906 USGS map shows four buildings within the vicinity of the project location, likely parts of the Ivans and McIlvain properties (see Figure 3.9; USGS 1906).

Aerial photography shows the dwellings and associated farm fields directly west of the D&BBRR (Figure 3.10; NETR 1931, 1940). One building was located at the corner of Scotch Road and Upper Ferry Road, likely one of the McIlvain properties (NETR 1940). By 1947, land within and surrounding the project location was cleared and graded to make way for runways and airport facilities (NETR 1947). The former Ivans house was razed by the mid-1940s and the portion of Upper Ferry Road situated west of Scotch Road had been removed (NETR 1947). Development continued to occur within the project location throughout the mid-twentieth century in the form of vegetation clearing, grading, and runway and building construction (Figure 3.11; NETR 1947, 1953, 1957, 1958). Between 1958 and 1963, the portion of Scotch Road northeast of the project location was realigned to its present location (NETR 1958, 1963). Between 1971 and 1979, the West Branch Shabakunk Creek was redirected via underground pipeline along the northeast portion of the project location (Figure 3.12; NETR 1971, 1979). By 1995, construction within the project location had slowed, with only a handful of buildings being erected on the property during the twenty-first century (NETR 1995, 2019). Numerous utilities were also installed in the area between the ATCT building and the terminal to the southeast (Figure 3.13; Google Earth 2021).

Trenton-Mercer Airport

Established during the early 1940s in Ewing Township, Mercer County, the Trenton-Mercer Airport was the second airport built in what is commonly known as the West Trenton area. The first airport, known as the Mercer Airport, was built during the late 1920s by the Mercer County Board of Freeholders and located to the northwest of the present-day airport complex, on the land now occupied by the Mountain View Golf Course (Block 372, Lots 1, 4, 5, 10–12). By October 1927, the Mercer Airport contained a primitive grass landing that was initially used by mail pilots (Trenton Evening Times [TET], 24 January 1928:9). Shortly after, the Mercer County Board of Freeholders committed to building a full-service airport and approved $50,000 for the effort (TET, 17 April 1928:1). A portion of the allotted funds was used to purchase the Hervey Scudder Farm along Bear Tavern Road, and, in February 1929, the freeholders advertised for bids to construct the first aircraft hangar on the site to

accommodate at least 10 airplanes, a mechanical shop, administration office, and gas station (TET, 1 February 1929:13). The Mercer Airport officially opened in August of that year, in conjunction with Trenton's 250th anniversary, with a dedication ceremony featuring an aerobatic demonstration that attracted 2,000 spectators (Tesauro 2002:25). By 1930, Mercer Airport offered personnel for servicing and maintenance, repair facilities, gas and oil, telephones, and meals (Airport Consultants, Inc 1930).

The old Mercer Airport continued to operate until the early 1940s; however, three months after the United States entered World War II, it was determined that the Mercer Airport was not big enough to accommodate military aircraft activity. This led to the Mercer County Board of Freeholders announcing plans to construct a new airfield immediately southeast of the existing airport and set the foundation for the present-day Trenton-Mercer Airport. Originally known as Mercer Field, the three intersecting runways were built by the Civil Aeronautics Board in 1942 (TET, 9 March 1949:1). Essential buildings such as hangars and barracks were built by the federal government before the airfield was officially commissioned by the United States Navy in July 1943 to operate as the Naval Aircraft Delivery Unit (Stell Environmental Enterprises, Inc. 2013:5-3). An early 1940s Map of Mercer Field depicts the naval facilities built in the north section of the airport complex which included a total of 39 buildings and structures, a few of which were repurposed and are still extant today. The remaining Naval buildings include: the Main Storehouse, the Vehicles Maintenance Shop and Public Works Shop, the Welding Shop, and the Paint Chemical Storage and Photo Lab (National Archives Catalog n.d.). The old Mercer Airport was officially closed in March 1942 (Reilly 1997:110).

Not long after the establishment of Mercer Field, the General Motors (GM) Ternstedt plant, located south of Parkway Avenue along the southern terminus of the airfield, was incorporated into GM's Eastern Aircraft Division. The Ternstedt plant was initially used to manufacture automobile hardware but, in 1941, the plant was shut down by the government to curtail the use of vital war materials. Shortly after, the Eastern Aircraft Division was formed, and GM converted the plant into an aircraft factory to support the war effort and to test aircrafts for the United States Navy (TET, 3 March 1942:11). During the war, 7,500 Avenger torpedo bombers were produced at the GM Ternstedt plant and then tested at Mercer Field for military service (TET, 23 January 1955:13). Eventually, the Navy would go on to test more than 15,000 planes at the airfield (TET, 23 January 1955:13).

By the end of World War II, the 1945 AAF Airfield Directory described the Mercer Airport as a 305-acre property having two sod runways and three hangars, although "not in operation" (Freeman 2019). Following the war, the housing shortage led to discussions about using the naval barracks on the property for Veteran housing; however, it is unclear whether or not the empty facilities were actually used (TET, 11 December 1945:1). In 1947, the Mercer County Freeholders requested that the government return ownership of Mercer Field, along with "all its buildings, land, facilities, and equipment," so that air service could be provided to the greater Trenton area (TET, 22 October 1947:2). Although the Mercer County Freeholders did not have ownership at the time, they began looking to lease the airport facilities to a large company that would manage the airfield and provide adequate service to the surrounding community (TET, 22 October 1947:2). It was also during this time that the Navy informed the Mercer County Board of Freeholders that it planned to build a test facility on the 74-acre parcel adjacent to Mercer Field along Parkway Avenue. The site was designated as the Naval Aeronautical Turbine Test Station (NATTS) and officially opened on November 4, 1955. For the next several decades, the laboratory, located southeast of the airport, was in full operation and later played an integral role in the development of military technology during the Cold War (Louis Berger & Associates, Inc. 1996; NETR 1953).

Preparations for turning Mercer Field into a commercial airport began in 1949 with ownership and maintenance of Mercer Field still in discussion between the County and the federal government (TET, 9 March 1949:1). The airport was not used for seven years, and, during this time, the runways and facilities sat idle and were not well maintained. It was not until 1952 that the Department of Defense and the Navy canceled the lease on the airfield and the government finally surrendered the facility back to the Mercer County Board of Freeholders (TET, 21 September 1947:9, 23 March 1949:1, 10 January

1952:3). Although the Navy cancelled their lease on the airfield, a new 20-year lease was drafted for "all Navy-owned property north of Ridge Road known as the barracks area" (Stell Environmental Enterprises, Inc. 2013:5-3).

During the early 1950s, the County saw Mercer Field as an opportunity to encourage industrial growth in the area. In August 1952, Chase Aircraft signed a 99-year lease for 54 acres of land within the airport in the empty section near Bear Tavern Road. They began plans to build "several work hangars and added office space" (TET, 22 August 1952:1). A 1953 historic aerial suggests that Chase Aircraft likely built the hangar building (no longer extant) shown approximately 1,950 feet northeast of Bear Tavern Road along present-day Sam Weinroth Road (see Figure 3.11; NETR 1953). In an attempt to turn the airport back into a civilian enterprise, Mercer County Freeholder John E. Curry worked with Allegheny Airlines to offer flights to the general public. In 1955, civilian commercial passenger service began at Mercer Field, and within just three years, the airport had hosted 30,000 private and commercial flights (Trenton Sunday Times-Advertiser, 26 April 1959:1). Several buildings were constructed within the airport complex during the 1950s, including the present-day HomeFront Family Campus building which was originally built as a Naval Communications Unit during the Cold War and then repurposed into the "Naval Communications Unit No. 11" in 1957 for the former Inspector-Instructor West Trenton Facility (Stell Environmental Enterprises, Inc. 2013:5-3; NETR 1953, 1957).

By the 1960s, the conversion of Mercer Field into a modern air center was well underway, and a county publication for the Tercentenary Commission reported several improvements completed by the County. The improvements included extending the runways, the construction of a new control tower, and installment of an all-weather instrument-landing. In addition to the new Air Traffic Control Tower, two additional buildings were constructed during the 1960s, including a Garage and the building that currently houses the Johnson and Johnson Aviation Hangar. It was also during this time that the airport name was changed for the first time to Mercer County Airport (Gemmell and Havens 1964). In 1969, a fire broke out at the airport, leveling a large hangar and the Allegheny Airlines waiting room and office and the airport restaurant. Multiple aviation fleets were destroyed, causing damage exceeding $3 million (TET, 15 April 1969:3). After Allegheny Airlines threatened to withdraw flights, the county began constructing a temporary terminal, consisting of two trailers and an 800-foot runway extension in 1970 (TET, 27 January 1970:50). Most of the early-1940 naval buildings were demolished in the late 1960s and 1970s (NETR 1969, 1971, 1979).

The current Trenton-Mercer Airport Terminal was completed in 1976 (NETR 1979; TET, 8 January 1975:31). That same year, the New Jersey Army National Guard constructed the maintenance hangar and army aviation support facilities east of the runways to the west of Scotch Road's intersection with the railroad (HDR, Inc. 2015). The facility was developed as a heliport and continues to be used by the New Jersey Army National Guard today (HDR, Inc. 2015:26). By 1979, the smallest and westernmost runway that abutted the new airport terminal was converted into a taxiway and seven more buildings were erected within the airport complex, including the Vehicle Maintenance Building, a Garage, the Lighting Equipment Room, the East Hangars, the Signature Aviation Hangar, and two circa-1975 Hangars (see Figure 3.12; NETR 1979). Development within the airport complex continued throughout the late twentieth century with the Fire Station, a Gun Shed, a Storage Building, the Salt Dome, the Fueling Station, and some of the Corporate Hangars (NETR 1995). The county-owned airport officially became the Trenton-Mercer Airport in 1995.

During the twenty-first century, several more Corporate Hangar buildings were erected, and the Pfizer, Inc. Hangar, the Trenton Corporate Air Wing Hangar, two garages, a Utility Building, a Hangar, and the Office Building were all constructed by 2010 (NETR 2002, 2004, 2006, 2007, 2008, 2010). Around 2011, the former Chase Aircraft building was demolished and turned into a parking lot (NETR 2010, 2012). Sometime around 2015, the former Naval Communications Unit No. 11 was drastically renovated to its current appearance and function as the HomeFront Family Campus (Stell Environmental Enterprises, Inc. 2013). The most recent building erected within the complex is the Luggage Building, which was constructed around 2014 (see Figure 3.13; Google Earth 2021). It is located just north of the Trenton-Mercer Terminal Building. Presently, Trenton-Mercer Airport is a joint civil-military public airport.

3.4 Known Archaeological Sites and Prior Investigations

New Jersey State Museum Site Files

A review of the NJSM site files and published references (Cross 1941; Skinner and Schrabisch 1913) indicated that no registered archaeological sites are located within the APE-Archaeology. Five registered archaeological sites are located within a 1-mile radius of the APE-Archaeology (Table 3.1). The nearest known pre-Contact site is the Runway 6 Site (28-Me-387), located 3,600 feet southwest of the APE-Archaeology, which yielded non-diagnostic artifacts comprising eight flake fragments, one sandstone cobble tool, and two hearth rocks from shallow, predominately disturbed soils. The nearest historic site is the Trenton-Mercer Airport Archaeological Foundation Site (28-Me-390), situated 2,200 feet east of the APE-Archaeology, which consisted of stone masonry structural remains composed of schist, shale, and brick mortared with Portland cement. The age and function of the structure, which is situated adjacent to railroad tracks, is unknown.

Table 3.1: Registered archaeological sites within a 1-mile radius of the APE-Archaeology.

Site Number/ Name	Period/Type	Distance/ Direction from the APE-Archaeology	Closest Water Source/Distance	Reference
28-Me-271	Pre-Contact, unknown date/ Lithic scatter	4,000 feet/North	Ewing Creek/ 660 feet	NJSM
28-Me-272/ Welling-Hough Farmstead	Historic, mid-nineteenth to early twentieth century/ Farmstead	3,350 feet/Northeast	Ewing Creek/ 330 feet	NJSM
28-Me-370/ Hart Farmstead	Historic, early eighteenth- to mid-nineteenth-century/ Farmstead	4,380 feet/North	Ewing Creek/ 850 feet	NJSM
28-Me-379/ Burroughs-Dobbins Historic Site	Historic, late nineteenth-century/ Domestic deposits	2,600 feet/Southeast	Delaware River tributary/ 1,160 feet	NJSM
28-Me-387/ Runway 6	Pre-Contact, unknown date/ Lithic scatter	3,600 feet/Southwest	Delaware River tributary/Adjacent	NJSM
28-Me-390/ Trenton-Mercer Airport, Archaeological Foundation	Historic, unknown/ Stone-masonry foundation (unknown function)	2,200 feet/East	West Branch Shabakunk Creek tributary/380 feet	NJSM

APE – Archaeology: Area of Potential Effects for Archaeology
NJSM – New Jersey State Museum files

Cultural Resources Surveys

A review of files at the NJHPO indicated that four prior archaeological surveys have been conducted within or adjacent to the APE-Archaeology (Crossroads of the American Revolution National Heritage Area 2011; GAI Consultants, Inc. 1991; Mounier 2015; RGA, Inc. 2019).

GAI Consultants, Inc. (1991) conducted a Phase I cultural resources investigation along portions of the West Branch Shabakunk Creek in conjunction with a flood control project for the U.S. Army Corps of Engineers. The Trenton-Mercer Airport was included within the survey's study area; however, no subsurface archaeological testing was conducted within or adjacent to the current APE-Archaeology and no further archaeological survey was recommended (GAI Consultants, Inc. 1991).

A broad-based cultural resources survey entitled *Crossroads of the American Revolution, National Heritage Area Management Plan, Part II Implementation Plan* was published in 2011 and details the Crossroads of the American Revolution's policies, guidelines, actions, and plans for cultural heritage programs to develop a better understanding of the American Revolution in New Jersey. Based on the information provided, no battles or skirmishes occurred within the APE-Archaeology (Crossroads of the American Revolution National Heritage Area 2011).

In 2015, a Stage IA survey of the Trenton-Mercer Airport was conducted in conjunction with an obstruction removal project involving the proposed removal of trees and other structures that posed potential aviation hazards (Mounier 2015). The survey encompassed areas to the north, southeast, and southwest of the current APE-Archaeology. A Stage IB survey was recommended approximately 1,800 feet southwest of the current APE-Archaeology in an area assessed with high pre-Contact archaeological sensitivity. No further archaeological survey was recommended within or adjacent to the current APE-Archaeology (Mounier 2015).

In 2019, RGA conducted a Phase IA historical and archaeological survey and Reconnaissance-level historic architectural survey for proposed improvements to the Trenton-Mercer Airport (RGA, Inc. 2019). The survey included expansions to the existing terminal building to the northwest of the current APE-Archaeology, as well as a proposed aircraft rescue and fire-fighting building directly east of the APE-Archaeology. No further archaeological survey was recommended at either location due to extensive disturbance from underground utilities and aboveground construction (RGA, Inc. 2019).

3.5 Known Historic Architectural Resources and Prior Investigations

Known Historic Properties

There are three historic properties listed in or previously determined eligible for listing in the NJR or NRHP located within the APE-Architecture: the Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996), the First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008), and the Delaware and Bound Brook (Reading) Railroad Historic District (D&BBRRHD) (SHPO Opinion: 9/9/2005). These historic properties are discussed in further detail in Section 5.1.

Planning Surveys

The Mercer County Historic Sites Survey: Ewing, East Windsor, West Windsor, and Washington Townships did not identify any historic architectural resources within or adjacent to the APE-Architecture (Kinsey & Hand 1988).

In December 1989, Hintz Associates, Inc. conducted a Preservation Plan for Mercer County. The plan was completed for the Mercer County Cultural and Heritage Division as a non-binding advisory document for the current and future preservation efforts of the county. The plan identified one resource within the APE-Architecture: the First Presbyterian Church at 100 Scotch Road. The identified property includes a Romanesque-Revival sanctuary built in 1867 and an associated graveyard (Hintz Associates, Inc. 1989). It was subsequently determined eligible for listing in the NRHP in 2008 and is discussed in further detail in Section 5.1.

Regulatory Surveys

A review of files at the NJHPO indicated that seven prior cultural resources surveys with a historic architectural component have been conducted within or adjacent to the APE-Architecture (HDR, Inc. 2015; Louis Berger & Associates, Inc. 1996; Lynn Drobbin & Associates 2005, 2006; RGA, Inc. 2019; Southeastern Archaeological Research, Inc. [SEARCH] 2013; Stell Environmental Enterprises, Inc. 2013).

In 1995, a Cultural resources survey was conducted for the Naval Air Warfare Center Aircraft Division in Trenton, New Jersey. Completed by Louis Berger & Associates, Inc., work included historical research, a Phase IA archaeological investigation, and an inventory and assessment of all buildings and structures with regard to their eligibility for listing in the NRHP. Although only 40 years of age, the Aeronautical Turbine Laboratory was determined eligible for listing in the NRHP under Criteria A and C and Criteria Consideration G (Louis Berger & Associates, Inc. 1996). This historic property is discussed in further detail in Section 5.1.

Lynn Drobbin & Associates prepared a Historic architectural resources background study for a passenger service restoration project on the New Jersey Transit West Trenton Line between West Trenton and the Raritan Valley Line, along an approximately 27-mile-long linear project area. The

first phase of the report, completed in 2005, determined that the West Trenton Line was an eligible historic district known as the Former Delaware & Bound Brook Railroad (the NRHP-eligible D&BBRRHD). This district extends from Trenton to Weehawken and runs north–south along the east border of the current APE-Architecture. As part of the line's proposed reactivation of passenger service, approximately 17 miles of track would be added within the right-of-way as well as five additional stations and parking lots, a train storage yard, and 23 bridges. In 2006, a Section 106 Effects Assessment determined the project to have no adverse effect on the NRHP-eligible historic property (Lynn Drobbin & Associates 2005, 2006). The eligible historic property is discussed in further detail in Section 5.1.

In 2013, SEARCH conducted a Phase IA cultural resources survey of the former Inspector-Instructor West Trenton Facility, located within the current APE-Architecture. The survey was performed at the request of the Naval Facilities Engineering Command Atlantic prior to the proposed transfer of the property out of federal ownership. The property contains three buildings ranging in construction date from 1953 to 1990, comprising the Communications Building, the Vehicle Maintenance Building, and the Gun Shed. It was determined that additional research was needed to clarify the historic context of the Communications Building during the Cold War-era in order to inform recommendations of eligibility. In 2013, a Phase IB cultural resources survey was completed by Stell Environmental Enterprises, Inc. who determined that none of the facility buildings were eligible for listing in the NRHP (SEARCH 2013; Stell Environmental Enterprises, Inc. 2013). Between 2013 and 2016, the complex was heavily altered and converted into the Homefront Family Campus. The three buildings are extant and within the larger Trenton-Mercer Airport (RGA 2) property which is discussed in further detail in Section 5.1.

In May 2015, an architectural survey was conducted for the New Jersey Army National Guard (NJARNG) to evaluate the eligibility of selected facilities throughout the state. In total, 61 buildings were surveyed at 28 installations. One of the surveyed resources is located within the current APE-Architecture: the New Jersey Army National Guard Trenton-Mercer Armory. The resource does not actually contain an armory building but a NJARNG Maintenance Hangar and Vehicle Maintenance Shop built in 1976. The survey determined that the resource was not individually eligible for listing in the NJR or NRHP (HDR, Inc. 2015). The resource is part of the larger Trenton-Mercer Airport (RGA 2) property which is discussed in further detail in Section 5.1.

In July 2019, RGA conducted a Phase IA historical and archaeological survey and Reconnaissance-level historic architectural survey for proposed improvements to the Trenton-Mercer Airport. The survey identified five previously unevaluated architectural resources that were more than 50 years of age, including the mid-twentieth-century ATCT that will be demolished as a part of the current project, two mid-twentieth-century hangars, an early twentieth-century residence, and a mid-twentieth-century airport runway. The survey determined that the resources did not possess sufficient integrity or significance to warrant survey at the intensive level (RGA, Inc. 2019). All of these resources are located within the larger Trenton-Mercer Airport (RGA 2) property which is discussed in further detail in Section 5.1.

New Jersey Historic Bridge Survey

There are no bridges identified by the New Jersey Historic Bridge Survey within the APE-Architecture (A. G. Lichtenstein & Associates, Inc. 1994).

New Jersey Historic Roadway Study

There are no identified historic roadways inside the APE-Architecture (KSK Architects Planners Historians, Inc. 2011).

Historic Preservation Element (Master Plan)

The Master Plan for Ewing Township contains a Historic Preservation Element, which identifies one historic resource within the APE-Architecture, the Aeronautical Turbine Laboratory Complex Historic District (Ewing Township Planning Board 2006). This NRHP-eligible historic property is discussed in further detail in Section 5.1.

4.0 ARCHAEOLOGICAL SURVEY

4.1 Pedestrian Reconnaissance

A pedestrian survey of the entire APE-Archaeology was conducted on June 7, 2023, by Theodore Gold, MA, RPA, to document existing conditions and to assess the potential for pre-Contact and historic archaeological resources (Figure 4.1; Plates 4.1–4.21).

The southern portion of the APE-Archaeology adjoins Upper Ferry Road and consists of a paved parking lot leading up to the fenced-in NJARNG facilities (see Figure 4.1; see Plates 4.1–4.3). Within the NJARNG facilities, the APE-Archaeology consists of manicured grass and paved surfaces related to the nearby helipad and associated structures (see Plates 4.4–4.16). The portion of the APE-Archaeology northeast of the helipad lies along a slightly sloped area of cleared grassland (see Plates 4.17–4.19). The abandoned ATCT lies on an asphalt pad within the runway, which is itself an artificially flattened grassy plane (see Plate 4.20). The area between the abandoned ATCT and the NJARNG facilities has been graded for runway construction and contains underground utilities. As recently as April 5, 2021, large grading excavations have occurred between the ATCT and the NJARNG facilities, particularly between the ATCT and Runway 16-34, which are visible in a Google Earth image (Google Earth 2021; see Figure 3.13). Asphalt-paved areas and locations with buildings and buried utilities at the NJARNG facility in the eastern portion of the APE-Archaeology show evidence of previous grading disturbance. Grassy areas surrounding the helicopter pads in this portion of the APE-Archaeology do not exhibit signs of prior disturbance (see Plate 4.21).

4.2 Assessment of Archaeological Resources Sensitivity

The archaeological sensitivity assessment considers environmental characteristics of known pre-Contact sites in the region and historic records to identify locations within the APE likely to contain pre-Contact and historic period archaeological resources. In areas where no sites are documented, the potential presence of pre-Contact resources is based primarily on topography, availability of lithic and environmental resources, proximity to water, and soil characteristics. The potential presence of historic resources is determined through analysis of historic primary and secondary records and cartographic materials. The proximity of historic transportation routes and natural resources (mineral resources, building materials, energy sources) also increases the probability that historical archaeological sites are present.

Pre-Contact Archaeological Sensitivity

Archaeological studies of pre-Contact settlement patterns in New Jersey indicate that well-drained soils near perennial water sources and wetlands are particularly sensitive for pre-Contact archaeological sites (Cavallo and Mounier 1982; Chesler 1982; Grossman-Bailey 2001:136; Kraft 1986, 2001; Ranere and Hansell 1985, 1987; Walwer and Pagoulatos 1990). Sites are also found on drainage divides and upland areas located further from water bodies, though less frequently than in areas nearer water (Mounier 1998). Other variables influencing pre-Contact site location include soil properties, level topography, historically documented trails, and exploitable subsistence or technological resources (Cavallo and Mounier 1982; Hasenstab 1991; Pagoulatos and Walwer 1991).

Modifications of the naturally occurring landscape in the APE-Archaeology were extensive in the twentieth century, including airport development and the installation of underground utilities, as indicated on historic aerial images and existing conditions (NETR 1953, 1957, 1958, 1963, 1971, 1979, 1995, 2010). A Google Earth image dating to April 2021, also shows extensive grading between the ATCT and Runways 16-34 and 6-24. The area around the existing ATCT and between the ATCT and Runways 16-34 and 6-24 is located 820 feet from a former tributary and is assessed with low pre-Contact period Native American archaeological sensitivity. The southeastern portion of the APE-Archaeology is situated adjacent to a

perennial water source along the West Branch Shabakunk Creek that was realigned and modified in the 1970s to create a lagoon. Large sections in this portion of the APE-Archaeology were extensively disturbed and graded as a result of the construction of the NJARNG facilities in the 1970s. Disturbed areas have an assessed low sensitivity for intact pre-Contact archaeological resources. Undisturbed grassy areas surrounding the helicopter pads within 500 feet of the former West Branch Shabakunk Creek alignment have an assessed high sensitivity for intact pre-Contact archaeological resources (see Figure 4.1).

Historic Archaeological Sensitivity

Historic archaeological sensitivity, which is based on models of Colonial, Federal, and Early Industrial period land uses, is typically ranked as high near areas of documented historic occupation, standing historic structures, and early transportation routes. Areas of low historic archaeological sensitivity generally include areas with little record of historic land development or those that have been demonstrably disturbed by construction or other activities. Information obtained from cartographic evidence also contributes to assessments of historic archaeological sensitivity. While early historic maps do not always depict historic buildings with accuracy, nineteenth-century maps often record details of settlement pattern, ownership, and occupation.

Background research indicated that historic settlement in the vicinity of the APE-Archaeology likely began during the eighteenth century. Scotch Road and a precursor to Upper Ferry Road were present by the early nineteenth century at the latest, and buildings are depicted on mid-nineteenth-century maps to the west and east of the APE-Archaeology. To the west, the closest map-documented building stood 540 feet away and was razed during the airport's construction. Near the eastern portion of the APE-Archaeology, the former McIlvain farmstead stood 475 feet to the northeast and a building with an unattributed name on historic maps stood 130 feet to the east and was separated from the APE-Archaeology by a tributary. By the mid-1940s and into the 1970s, extensive disturbance occurred within the APE-Archaeology as a result of airport and NJARNG facility construction, as well as the installation of utilities, which has continued into the 2020s. Based on the results of background research and the pedestrian reconnaissance, the APE-Archaeology is considered to possess low sensitivity for historic archaeological resources.

5.0 INTENSIVE-LEVEL HISTORIC ARCHITECTURAL SURVEY

Fieldwork for the Intensive-level historic architectural survey was conducted on August 29 and September 10, 2024, and consisted of the identification of historic architectural resources listed in or eligible for the NJR and the NRHP, as well as previously unevaluated architectural resources of more than 50 years of age within the APE-Architecture. The survey identified 22 resources over 50 years of age within the APE-Architecture (Figure 5.1; Plates 5.1–5.31). Of these, three were previously determined eligible for listing in the NRHP: the Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996), the D&BBRRHD (SHPO Opinion: 9/9/2005), and the First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008). The First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008) and the Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996) were resurveyed at the intensive level as part of this project in order to properly assess effects.

The remaining 19 historic architectural resources within the APE-Architecture were surveyed at the intensive level and consist of the Trenton-Mercer Airport (RGA 1), an early twentieth-century cemetery and crematory (RGA 12), an early 1970s shopping center (RGA 13), a mid-twentieth-century school (RGA 20), 11 houses built between the late nineteenth and mid-twentieth centuries (RGA 4–7, 14–19, and 21), a mid-twentieth-century gas station (RGA 11), and three mid-twentieth-century industrial/commercial buildings (RGA 8–10). As a result of the survey, one of the historic resources was recommended eligible for listing in the NRHP, the First Presbyterian Church and Cemetery of Ewing (RGA 3). Additionally, the survey for the Aeronautical Turbine Laboratory Complex Historic District (RGA 2) determined that the complex remained eligible under Criterion A for its associations with aeronautical technology advancements following World War II and during the Cold War and under Criterion C as a well-preserved collection of mid-twentieth-century industrial buildings built by the Navy for aeronautical testing and research. The complex was constructed in two phases of development spanning from 1942 to its closure in 1998. The earliest buildings on the property were constructed by General Motors during the 1940s to support their West Trenton-based naval aircraft manufacturing plant during World War II. Following the war, in 1949, ownership of the property was transferred to the United States Navy and ground was broken for the second phase of development which included the construction of the Aeronautical Turbine Laboratory (ATL). At the time of its completion during the mid-1950s, the ATL "was reportedly the most powerful and [technologically] advanced aircraft gas-turbine engine test facility in the world" (Louis Berger & Associates, Inc. 1998:1). Even after its completion, the ATL was continuously developed and improved to accommodate the rapid advancements made in aeronautical technologies during the mid-twentieth century. Overall, the studies done at the ATL made vital contributions to aeronautical engineering, safety, and aviation science "by gathering empirical data and then establishing aircraft industry standards governing the performance of engines, lubricants, and fuels" (Louis Berger & Associates, Inc. 1998:1). These studies ultimately led to notable advancements in the United States' military jet-engine technology during the Cold War military-arms race. At the height of its operations the complex consisted of over 25 buildings and structures. Fieldwork conducted on August 29 showed that the complex was in the process of being fully demolished for redevelopment. As a result, the historic property no longer retains integrity of materials, design, workmanship, feeling, or association and, as such, can no longer be found eligible for listing in the NRHP. For this reason, despite its historical and architectural significance, the Aeronautical Turbine Laboratory Complex Historic District was ultimately not recommended eligible for listing in the NRHP. The intensive-level survey, including individual building descriptions, historical development, and assessments of significance, integrity, and NRHP eligibility, has been conducted in accordance with the NJHPO's *Guidelines for Architectural Survey* (Splain 1999) and has been compiled on NJHPO Survey Forms located in Appendix E of this report.

5.1 Identification of Historic Architectural Properties

Delaware and Bound Brook (Reading) Railroad Historic District (SHPO Opinion: 9/9/2005)
The D&BBRRHD is eligible for listing in the NRHP under Criterion A (see Plate 5.8). The construction of the railroad is credited for breaking the monopoly of rail transportation between Philadelphia and New York, which was held by the Pennsylvania Railroad, the successor to the Camden & Amboy Railroad. The D&BBRR also improved the fortunes of the Central Railroad of New Jersey through increased traffic on the new line and gave the Philadelphia and Reading Railroad and the Baltimore and Ohio Railroad direct access to the Port of New York (Lynn Drobbin & Associates 2005). Contributing resources to the district within the APE-Architecture include the bridge that carries the railroad across Scotch Road, the track, and the trackbed.

First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008) (RGA 3)
The First Presbyterian Church and Cemetery of Ewing is a locally significant example of a Presbyterian church and associated burial ground in Ewing Township, Mercer County, New Jersey (see Plates 5.12–5.13). It is eligible for listing in the NRHP under Criterion A for its association with Ewing's settlement by English and Scottish Presbyterians and the site's ongoing use for worship, religious education, and burials by the local Presbyterian community. It is also eligible under Criterion C as a distinctive example of a mid-nineteenth-century Romanesque Revival-style church. The property has a period of significance from 1709, when the property was initially developed as a Presbyterian church and burial ground, to circa 1960, when many of the associated church buildings underwent alterations to their architecture and use.

5.2 Assessment of Effects

Delaware and Bound Brook (Reading) Railroad Historic District (SHPO Opinion: 9/9/2005)
As currently designed, the proposed project will have no adverse effect on the D&BBRRHD. The new ATCT may be visible from select locations within the section of the D&BBRRHD that extends along the east side of the airport within the APE-Architecture (see Plate 5.8). The linear historic district, which extends from Trenton to Weehawken, has seen alterations to its setting in numerous locations, and views of the new ATCT for rail passengers will be limited due to the presence of thick tree lines between the railroad right-of-way and the adjacent project location. Further, the project as proposed will not diminish the overall integrity and significance of the district, which is eligible for its association with historic transportation, commerce, and engineering advances in New Jersey. For these reasons, the project as proposed will have no adverse effect on the D&BBRRHD.

First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008) (RGA 3)
As currently designed, the proposed project will have no adverse effect on the First Presbyterian Church and Cemetery of Ewing and the relocation of the ATCT closer to the historic property combined with the increased height of the structure could slightly alter the setting. The historic property is eligible for listing under Criterion A for its religious associations with the English and Scottish Presbyterians and under Criterion C as an example of Romanesque Revival-style architecture and as a remarkable collection of burial markers. Presently, the historic property generally retains a secluded and bucolic setting, although it abuts the existing airport. Current modern intrusions include vehicular traffic along Scotch Road, which bisects the historic property, and noise from airport operations, including planes taking off and landing. Based on viewshed analysis, the existing ATCT is visible from limited areas including the tops of trees, the roof of the church, and in several discrete locations in the western section of the cemetery that date to the twenty-first century and were therefore built outside the period of significance for the historic property. While the current tower is visible from the property, it is not discernable during the daytime, and it is likely that view of the new tower will also be limited during the day.

In general, the proposed new ATCT will not drastically change or diminish the historic property's integrity of setting (see Plate 5.13). With the exception of one isolated location northwest of the church, views of the new ATCT will be concentrated in the western portion of the cemetery, where

graves were established during the twenty-first century and, since they were not constructed within the period of significance (1709–circa 1960), do not contribute to the significance or eligibility of the historic property. Although the proposed new ATCT will be more visible than the existing tower, it will not introduce a completely new visual element visible the historic property. Additionally, the uppermost area of the 117-foot tower will consist of scattered narrow antennas of approximately 20 feet in height that will be difficult to discern amongst the existing tree lines and against the backdrop of the sky. At night, the flashing beacon may be slightly more visible than the existing due to the change in height and location of the new tower, but the beacon will be located at the top of the cab, approximately 15 or 20 feet below the top of the tower, and will not be a drastic change from existing airport light pollution. Overall, visual effects to the historic property will be limited and will not diminish the character-defining features, including the Romanesque Revival design of the church and its historic associations with early Presbyterians in Ewing, that qualify the First Presbyterian Church and Cemetery of Ewing for listing in the NRHP. For these reasons, the project as proposed will not constitute an adverse effect to this historic property.

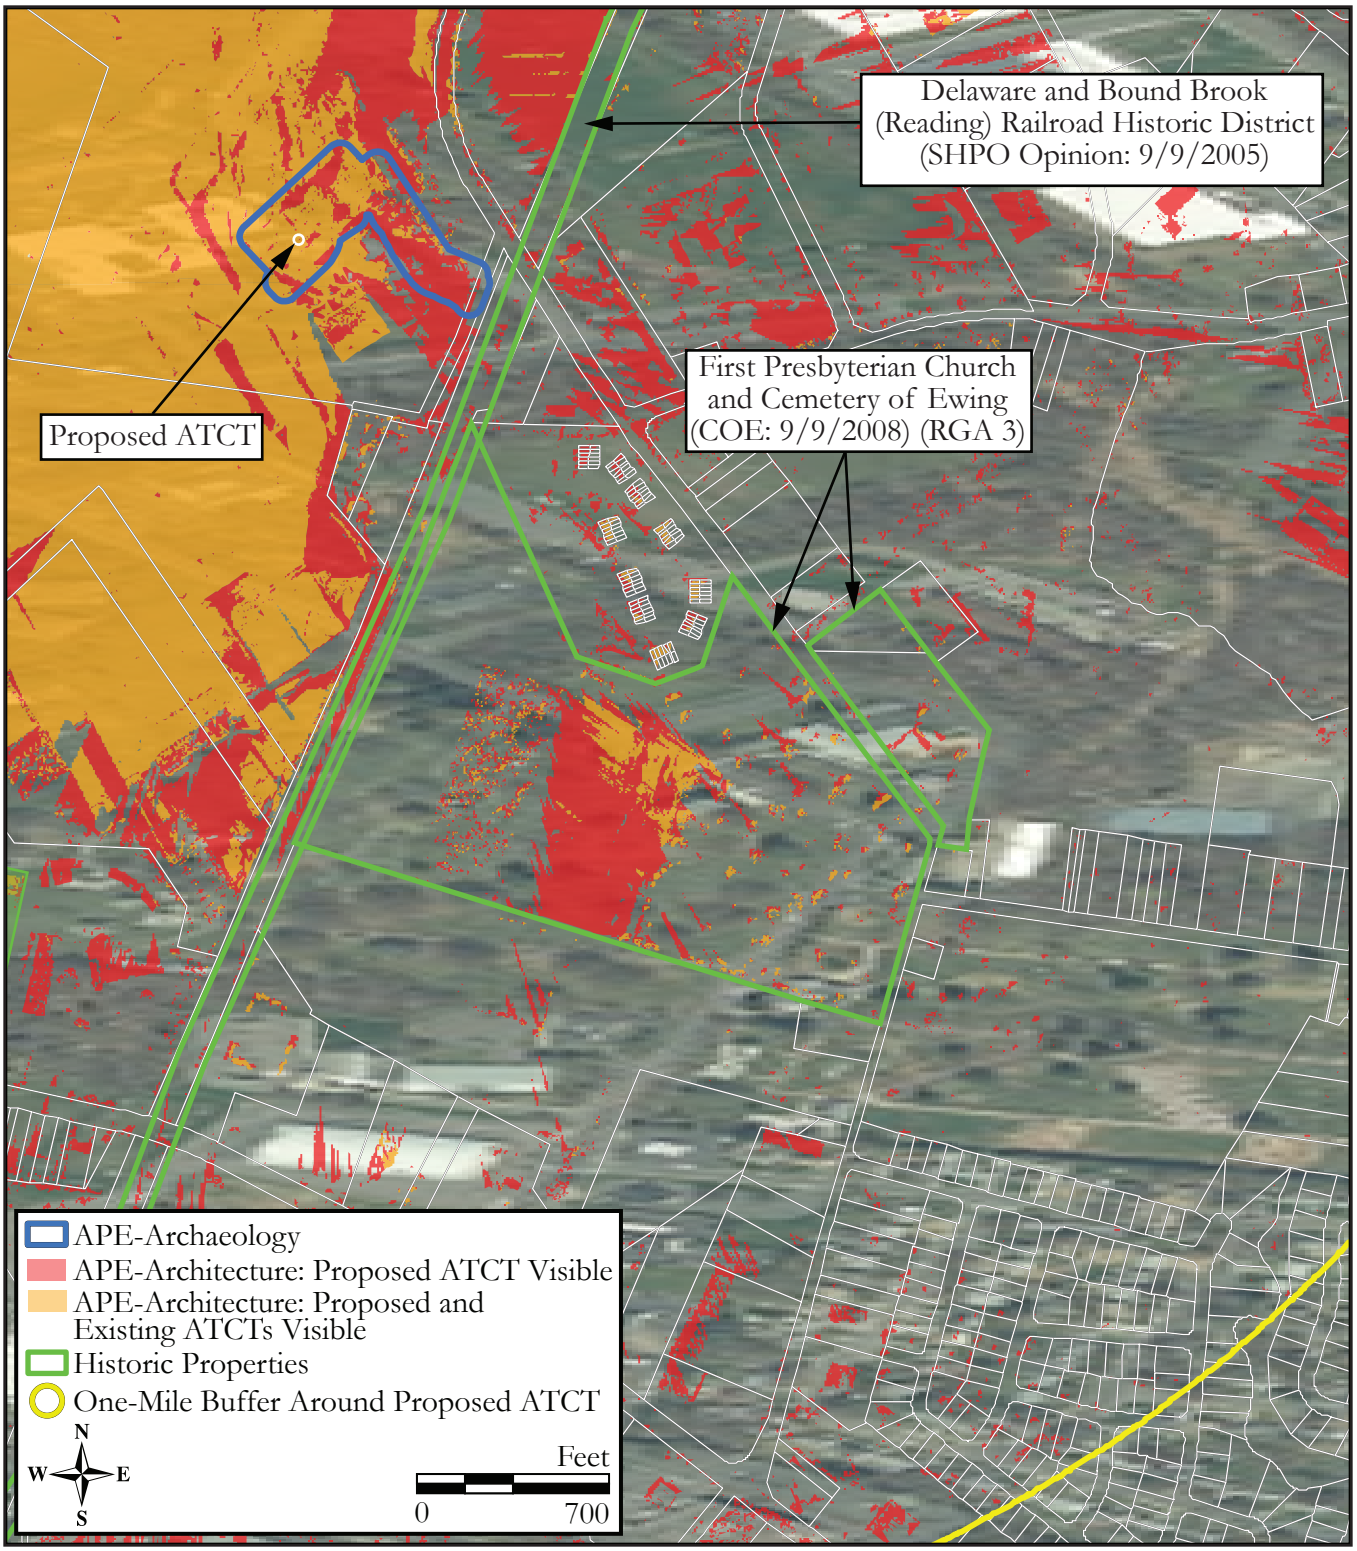

Figure 5.2: Detail aerial map showing the First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008) (RGA 3), the partially redacted APE-Archaeology, and the APE-Architecture (NJOGIS 2020).

6.0 CONCLUSIONS AND RECOMMENDATIONS

RGA completed a Phase IA historical and archaeological survey and Intensive-level historic architectural survey for proposed improvements to the Trenton-Mercer Airport located at 1100 Terminal Circle Drive and along Scotch Road in Ewing Township, Mercer County, New Jersey.

Based on background research, grassy areas surrounding existing helicopter pads in the eastern portion of the APE-Archaeology that are within 500 feet of the former West Branch Shabakunk Creek alignment have an assessed high sensitivity for pre-Contact period archaeological resources. The remainder of the APE-Archaeology has an assessed low sensitivity for pre-Contact period archaeological resources and all of the APE-Archaeology has an assessed low historic archaeological sensitivity. A Phase IB archaeological survey is recommended in areas of assessed high archaeological sensitivity. No further archaeological survey is recommended elsewhere in the APE-Archaeology.

The Intensive-level historic architectural survey concluded that there are three previously documented historic property listed in the NJR and/or NRHP or eligible for listing in the NRHP within the APE-Architecture: the Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996) (RGA 2), the D&BBRRHD (SHPO Opinion: 9/9/2005), and the First Presbyterian Church and Cemetery of Ewing (COE: 9/9/2008) (RGA 3). Nineteen additional resources were identified within the APE-Architecture and consist of: the Trenton-Mercer Airport (RGA 1), 11 houses built between the late nineteenth and mid-twentieth centuries (RGA 4–7, 14–19, and 21), an early twentieth-century cemetery and crematory (RGA 12), a mid-twentieth-century school (RGA 20), a mid-twentieth-century gas station (RGA 11), 3 mid-twentieth-century industrial/commercial buildings (RGA 8–10), and an early 1970s shopping center (RGA 13). As a result of the survey, RGA agreed with the 2008 Certificate of Eligibility and determined that the First Presbyterian Church and Cemetery of Ewing (RGA 3) does retain sufficient historic integrity to qualify for listing in the NRHP. The survey also determined that, due to its demolition, the Aeronautical Turbine Laboratory Complex Historic District (RGA 2) no longer retained sufficient historic integrity to qualify for listing on the NRHP.

Although the proposed project is located within the viewshed of the D&BBRRHD, Aeronautical Turbine Laboratory Complex Historic District, and the First Presbyterian Church and Cemetery of Ewing, the project will have no adverse effect on these historic properties. The project as proposed will not diminish the integrity of setting for the resources or the character-defining features that qualify them as eligible for listing in the NJR and NRHP. No additional historic architectural survey is recommended.

THEODORE GOLD
ARCHAEOLOGIST (36 CFR 61)

YEARS OF EXPERIENCE
With this firm: 2017-Present
With other firms: 3

EDUCATION
MA 2016
University of South Florida
Applied Anthropology

BA 2013
University of Chicago
Anthropology

PROFESSIONAL TRAINING
40-hour Health and Safety Training for Hazardous Waste Operations and Emergency Response (OSHA 29 CFR 1910.120), August 2017; 8-hour HAZWOPER Refresher, Annually

PROFESSIONAL REGISTRATION
REGISTER OF PROFESSIONAL ARCHAEOLOGISTS

Theodore Gold is an Archaeologist at RGA with experience conducting archaeological field investigations for Phase I and II archaeological projects in New Jersey, Pennsylvania, Delaware, and Florida. Mr. Gold's experience includes in-field and laboratory artifact analysis and processing, and report writing. He has worked on cultural resources surveys completed in accordance with Section 106 of the National Historic Preservation Act and other municipal and state cultural resource regulations.

Representative Project Experience:

1771 Imperial Way, West Deptford Township, Gloucester County, NJ (Sponsor: Private Developer) As Archaeologist, oversaw Phase IB archaeological field investigations in connection with the proposed Commercial Warehouse Development in West Deptford Township, Gloucester County. The work was completed as per the archaeological guidelines of the NJ Historic Preservation Office and in compliance with the Freshwater Wetlands Protection Act (Section 7:7A).

Serruto Properties Mixed Use Development, Old Bridge Township, Middlesex County, NJ (Sponsor: Private Developer) As Archaeologist/Research Assistant participated in Phase IB archaeological field investigations in connection with the proposed Serruto Properties Mixed Use Development in Old Bridge Township, Middlesex County. The ongoing project is being conducted as per the archaeological guidelines of the NJ Historic Preservation Office and in compliance with the Freshwater Wetlands Protection Act (Section 7:7A).

County Route 537 Improvements, Freehold Township, Monmouth County, NJ (Sponsor: Monmouth County/North Jersey Transportation Planning Authority) As Archaeologist/Research Assistant participated in Phase II archaeological field investigations and cataloguing artifacts at a historic archaeological site for proposed improvements to County Route 537 in Freehold Township. The goal of the Phase II archaeological survey was to evaluate the National Register eligibility of the site and to assess effects of the project on them. The work was completed as part of the Local Capital Project Delivery Program administered by the North Jersey Transportation Planning Authority.

Galloway Road Land Development Project, Bensalem Township, Bucks County, PA (Sponsor: Private Developer) Archaeologist/Research Assistant for the Phase I archaeological survey performed in connection with the Galloway Road Land Development Project in Bensalem Township, Bucks County. Participated in the excavation of approximately 150 Shovel Test Pits (STPs) within undisturbed portions of the project area. The ongoing survey is being performed in compliance with Section 106 of the National Historic Preservation Act, as amended.

Judge Nathaniel Foster House, Lower Township, Cape May County, NJ (Sponsor: Township of Lower) Principal Investigator for a Phase IA archaeological survey to assess the archaeological sensitivity of a property containing an eighteenth-century dwelling. The survey was conducted as a supporting document to a New Jersey Historic Trust Historic Site Management Grant application. Areas of archaeological sensitivity were identified and delineated. The report complied with New Jersey Historic Preservation reporting and survey guidelines.

LAUREN DUNKLE
ARCHITECTURAL HISTORIAN (36 CFR 61)

YEARS OF EXPERIENCE
With this firm: 2019-Present

EDUCATION
MA 2019
Savannah College of Art and Design
Preservation Design

BS 2018
Philadelphia University
Architectural Studies

PROFESSIONAL TRAINING
NJ TRANSIT Safety Training

Lauren A. Dunkle's experience includes historical research and writing, architectural surveys and analysis, and National Register nominations. Ms. Dunkle has worked on cultural resources surveys completed in accordance with Section 106 of the National Historic Preservation Act and other municipal and state cultural resource regulations. She has experience using the computer-aided mapping programs including ArcGIS and AutoCAD. Ms. Dunkle's educational and professional experience meet the qualifications set forth in the Secretary of Interior's Standards for an Architectural Historian [36 CFR 61].

REPRESENTATIVE PROJECT EXPERIENCE:

Conestoga to Royalton Transmission Replacement Project, Dauphin and Lancaster Counties, PA (Sponsor: Amtrak) Assistant Architectural Historian for historic architectural surveys for the proposed 29-mile electric transmission line replacement through portions of Pennsylvania. The project included reconnaissance- and intensive-level historic architectural surveys that identified all resources more than 50 years of age within the APE-Architecture. As a result of the reconnaissance-level survey, 34 historic properties were inventoried and an additional 4 resources were surveyed at the intensive level: the Jacob Eshleman Farm at 2365 River Road in Conoy Township, the John Engle Farm at 1865 River Road in Conoy Township, the Blue Rock Mill/ Witmer's Mill at 2251 River Road in Manor Township, and the Witmer/Schultz Farm at 2277 and 2262 River Toad in Manor Township. Researched and composed a site development history and historic context for the Blue Rock Mill in Lancaster Count resulting in the recommendation of historic resource being eligible Under Criterion C for architecture as a notable example of its type.

Middlesex County River Road Improvements, Piscataway Township, Middlesex County, NJ (Sponsor: Middlesex County) Architectural Historian for various mitigation measures performed in connection with the proposed improvements of River Road, a contributing resource to the Road Up Raritan Historic District. Project tasks included historical research, composition of a written history, design consultation, and preparation of an interpretive sign. Research included visiting local repositories to review archival documents such as historic maps and photographs.

Burlington County Historic Smithville Pedestrian and Bicycle Mobility Enhancements and Traffic Calming Improvements Project, Dunham Lane to Powell Road, Southampton and Eastampton Townships, Burlington County, NJ (Sponsor: Burlington County) As Assistant Architectural Historian, researched and composed a site development history and historic context for multiple subject parcels located within Smithville as part of a Phase II archaeological survey performed in connection with Burlington County's Historic Smithville Pedestrian and Bicycle Mobility Enhancements and Traffic Calming Improvements Project at Dunham Lane to Powell Road. Primary document research included the review of deeds, wills, and probate record to reconstruct the ownership history and land use of the subject parcels from the early eighteenth century through the twenty-first century.

Clifton Broad North, LLC Arch Culvert, Former Hepburn Road over the Third River, City of Clifton, Passaic County, NJ (Sponsor: Clifton Broad North, LLC) Architectural Historian for the Historic American Engineering Record (HAER) recordation of the late-nineteenth century Hepburn Road Culvert (CBN LLL Arch Culvert) spanning Third River in the City of Clifton. The work was undertaken to comply with the conditions of a New Jersey Freshwater Wetlands Permit and as a mitigation measure in advance of its proposed replacement.

Wireless Collocation at 300 Broadway, City of Newark, Essex County, NJ (Sponsor: U.S. Cellular) Architectural Historian for a visual effects assessment for a proposed wireless collocation project proposed to be located on a mid-1920s commercial building at 300 Broadway in the City of Newark. Delineated the Area of Potential Effects for Visual Effects and assessed the potential National Register eligibility for the condominium building. Determined that no historic properties would be adversely affected by the undertaking.

Compressor Station 321 Expansion Clifford Township, Susquehanna County, PA (Sponsor: Kinder Morgan) Architectural Historian for a Cultural Resources Survey for the proposed expansion of Compressor Station 321 along the Tennessee Gas Pipeline East 300 Line on two parcels in Clifford Township. The intensive-level survey identified two resources of more than 45 years of age within the APE-Architecture: the 1955 Tennessee Gas Pipeline Headquarters and an early twentieth-century former schoolhouse. Project tasks included historic research and the completion of two survey forms where the two identified resources were evaluated for National Register-eligibility. The work was completed in accordance with Section 106 of the National Historic Preservation Act of 1966, as amended. As a result of the Intensive-level historic architectural survey, neither of the surveyed resources were recommended eligible for listing in the NRHP.

APPENDIX B: SUMMARY OF NATIONAL REGISTER CRITERIA

1. State and National Registers of Historic Places Criteria
2. Criteria of Adverse Effect

1. State and National Registers of Historic Places Criteria

Significant historic properties include districts, structures, objects, or sites that are at least 50 years of age and meet at least one National Register criterion. Criteria used in the evaluation process are specified in the Code of Federal Regulations, Title 36, Part 60, National Register of Historic Places (36 CFR 60.4). To be eligible for inclusion in the National Register of Historic Places, a historic property(s) must possess:

> the quality of significance in American History, architecture, archaeology, engineering, and culture [that] is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and:

a) that are associated with events that have made a significant contribution to the broad patterns of our history, or

b) that are associated with the lives of persons significant in our past, or

c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components lack individual distinction, or

d) that have yielded, or may be likely to yield, information important in prehistory or history (36 CFR 60.4).

There are several criteria considerations. Ordinarily, cemeteries, birthplaces, or graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years shall not be considered eligible for the National Register of Historic Places. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following categories:

a) a religious property deriving primary significance from architectural or artistic distinction or historical importance, or

b) a building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event, or

c) a birthplace or grave of a historical figure of outstanding importance if there is no other appropriate site or building directly associated with his/her productive life, or

d) a cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events, or

e) a reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived, or

f) a property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own historic significance, or

g) a property achieving significance within the past 50 years if it is of exceptional importance. (36 CFR 60.4)

When conducting National Register evaluations, the physical characteristics and historic significance of the overall property are examined. While a property in its entirety may be considered eligible based on Criteria A, B, C, and/or D, specific data is also required for individual components therein based on date, function, history, and physical characteristics, and other information. Resources that do not relate in a significant way to the overall property may contribute if they independently meet the National Register criteria.

A contributing building, site, structure, or object adds to the historic architectural qualities, historic associations, or archeological values for which a property is significant because a) it was present during the period of significance, and possesses historic integrity reflecting its character at that time or is capable of yielding important information about the period, or b) it independently meets the National Register criteria. A non-contributing building, site, structure, or object does not add to the historic architectural qualities, historic associations, or archeological values for which a property is significant because a) it was not present during the period of significance, b) due to alterations, disturbances, additions, or other changes, it no longer possesses historic integrity reflecting its character at that time or is incapable of yielding important information about the period, or c) it does not independently meet the National Register criteria.

2. Criteria of Adverse Effect

Whenever a historic property may be affected by a proposed undertaking, Federal agency officials must assess whether the project constitutes an adverse effect on the historic property by applying the criteria of adverse effect. According to the Advisory Council on Historic Preservation, the criteria of adverse effect (36 CFR 800.5), is as follows:

> (1) An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that would qualify it for inclusion in the National Register, in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation for the property's eligibility for the National Register. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or cumulative.
>
> (2) Adverse effects on historic properties include, but are not limited to (36 CFR 800.5(a)(2)):
>
> i) Physical destruction of or damage to all or part of the property;
>
> ii) Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation and provision of handicapped access, that is not consistent with the Secretary's Standards for the Treatment of Historic Properties (36 CFR part 68) and applicable guidelines;
>
> iii) Removal of the property from its historic location;
>
> iv) Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;

v) Introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features;

vi) Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization; and

vii) Transfer, lease, or sale of property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance.

A finding of adverse effect or no adverse effect could occur based on the extent of alteration to a historic property, and the proposed treatment measures to mitigate the effects of a proposed undertaking. According to 36 CFR 800.5(3)(b):

> The agency official, in consultation with the SHPO/THPO, may propose a finding of no adverse effect when the undertaking's effects do not meet the criteria of § 800.5(a)(1) or the undertaking is modified or conditions are imposed, such as the subsequent review of plans for rehabilitation by the SHPO/THPO to ensure consistency with the Secretary's Standards for the Treatment of Historic Properties (36 CFR part 68) and applicable guidelines, to avoid adverse effects.

APPENDIX D: RECORD OF PUBLIC CONSULTATION

Agencies and individuals with an identified interest in archaeology, history, or historic preservation were sent consultation letters as part of this Phase IA historical and archaeological survey and Intensive-level historic architectural survey. The letters included a map showing the project location. Interested parties were asked to provide information on cultural resources that may be affected by the proposed project.

The following persons and/or organizations were contacted:

Idamis Perez-Margicin, Chief
c/o Lisa Tramo, Secretary to the Chief
Mercer County Culture & Heritage Division
640 South Broad Street, Room 417
P.O. Box 8068
Trenton, NJ 08650
Via email ltramo@mercercounty.org
Sent: June 18, 2023
Replied: None to date

Jim Castelize III, Chair

Re: **Consultation Letter, Phase IA Historical and Archaeological Survey and Reconnaissance-level Historic Architectural Survey, Trenton-Mercer Airport, Air Traffic Control Tower Relocation, Ewing Township, Mercer County, New Jersey**

Dear Dr. Leader:

Trenton-Mercer Airport in Ewing Township, Mercer County, New Jersey is proposing the removal of an existing air traffic control tower (ATCT) and the installation of a new (replacement) ATCT building and associated site improvements at the new ATCT, including an access road, parking, utilities, and landscaping. In advance of the proposed project Richard Grubb & Associates is performing a Phase IA archaeological survey and a Reconnaissance-level historic architectural survey to assess archaeological sensitivity and determine if buildings over 50-years of age are present in the project footprint and the viewshed of the new ATCT.

The proposed work falls under the review authority of the Federal Aviation Administration (FAA), necessitating compliance with Section 106 of the National Historic Preservation Act (NHPA), as amended, and the preparation of an Environmental Assessment (EA) under the National Environmental Policy Act (NEPA). If you are aware of any significant historic, or archaeological resources that may be affected by the project or have any information regarding the project, please respond within 10 days of receipt of this letter. Enclosed for your use is a USGS map showing the location of the proposed project. For safety reasons, proposed utility corridors associated with the project are not shown on the attached map.

If you have any concerns, or information pertinent to this project, RGA would be interested in receiving your comments. Please feel free to contact me at 415-531-3234 or via email at tgold@rgaincorporated.com.

Hi Ted,

I do not believe there to be anything of a historical importance in the areas you have highlighted, however I did want to point out that the Ewing Church Cemetery that is called out on your map has been issued a COE by the NJ SHPO office.

Re: **Consultation Letter, Phase IA Historical and Archaeological Survey and Reconnaissance-level Historic Architectural Survey, Trenton-Mercer Airport, Air Traffic Control Tower Relocation, Ewing Township, Mercer County, New Jersey**

Dear Ms. Tipton:

Trenton-Mercer Airport in Ewing Township, Mercer County, New Jersey is proposing the removal of an existing air traffic control tower (ATCT) and the installation of a new (replacement) ATCT building and associated site improvements at the new ATCT, including an access road, parking, utilities, and landscaping. In advance of the proposed project Richard Grubb & Associates is performing a Phase IA archaeological survey and a Reconnaissance-level historic architectural survey to assess archaeological sensitivity and determine if buildings over 50-years of age are present in the project footprint and the viewshed of the new ATCT.

The proposed work falls under the review authority of the Federal Aviation Administration (FAA), necessitating compliance with Section 106 of the National Historic Preservation Act (NHPA), as amended, and the preparation of an Environmental Assessment (EA) under the National Environmental Policy Act (NEPA). If you are aware of any significant historic, or archaeological resources that may be affected by the project or have any information regarding the project, please respond within 30 days of receipt of this letter. Enclosed for your use is a USGS map showing the location of the proposed project. For safety reasons, proposed utility corridors associated with the project are not shown on the attached map.

Additionally, please let the FAA know if you would like to be continuously consulted on the proposed undertaking and receive archaeological technical survey reports. The FAA will formerly notify you if the Phase Phase IA Historical and Archaeological Survey and Reconnaissance-level Historic Architectural Survey identifies Native American archaeological resources, burial sites, and/or Traditional Cultural Properties.

If you have any concerns, or information pertinent to this project, the FAA would be interested in receiving your comments. Please feel free to contact Ms. Heather Davis-Jenkins at 717-730-2835 or at heather.f.davis-jenkins@faa.gov.

Sincerely,

Rick Harner

Description:

Built in 1942 and developed throughout the twentieth century, the Trenton-Mercer Airport spans approximately 600 acres surrounded by Interstate 295 to the north and northwest, Bear Tavern Road to the southwest, Scotch Road to the northeast, SEPTA's West Trenton Line to the southeast, and a mix of residential, commercial, and industrial properties to the south. Today the airport complex contains over 34 buildings and structures that surround the two perpendicular asphalt-paved runways situated near the center of the property (Plates 1–9).

Additional Information:
In 2013, Stell Environmental Enterprises, Inc. completed a Phase IB cultural resources survey for the Former Inspector-Instructor West Trenton Facility located in the northern section of the Trenton-Mercer Airport complex. The survey identified three buildings: the former Communications Building (Building H), the Vehicle Maintenance Building (Building L), and the Gun Shed (Building V). The survey determined that the former Communications Building was too altered and did not retain enough historic integrity to be eligible for listing in the National Register of Historic Places (NRHP). The other two buildings were not 50 years old at the time of the survey and did not meet the significance thresholds for Criteria Consideration G (Stell Environmental Enterprises, Inc. 2013). *See Continuation Sheet*

☒ **BUILDING** ☐ **STRUCTURE** ☐ **OBJECT**

Common Name: Runways, Trenton-Mercer Airport
Historic Name: Runways, Mercer Field
Present Use: Transportation and Movement Activity, Vehicular Movement
Historic Use: Transportation and Movement Activity, Vehicular Movement
Construction Date: 1942 **Source:** National Archives Catalog n.d.
Alteration Date(s): Mid-twentieth century, circa 1975 **Source:** Nationwide Environmental Title Research (NETR) 1963, 1971, 1979
Designer: Unknown **Physical Condition:** Good
Builder: Civil Aeronautics Board **Remaining Historic Fabric:** Medium
Style: Other
Form: Other **Stories:** 2
Type: N/A **Bays:** N/A
Roof Finish Materials: Metal
Exterior Finish Materials Corrugated Steel; Concrete

Exterior Description:
Running perpendicular to each other and forming an "X" shape, the Runways are both paved in asphalt (see Plates 3 and 8). The northwest–southeast runway spans approximately 1 mile and the northeast–southwest runway spans approximately 1.25 miles. Multiple asphalt-paved taxiways intersect with the runways connecting them to the various hangars within the Trenton-Mercer Airport complex.

Interior Description:
Not accessible.

Setting:
The Runways span the center of the Trenton-Mercer Airport complex (Block 373, Lots 5, 7–10, Block 372.01, Lot 7, and Block 374, Lot 1). Grass landscaping surrounds the runways. The Air Traffic Control Tower (Building I) and Lighting Equipment Room (Building M) are approximately 680 feet to the west.

Common Name: Mercer County Sheriff's Office (Building A), Trenton-Mercer Airport
Historic Name: Main Storehouse, Mercer Field
Present Use: Institutional Activities, Public Safety activities
Historic Use: Unclassifiable Activities
Construction Date: Circa 1942 **Source:** National Archives Catalog n.d.
Alteration Date(s): Circa 1980 **Source:** NETR 1979, 1984
Designer: Unknown **Physical Condition:** Good
Builder: United States Navy **Remaining Historic Fabric:** Medium
Style: Other
Form: Other **Stories:** 1
Type: N/A **Bays:** N/A
Roof Finish Materials: Metal
Exterior Finish Materials Corrugated Steel; Concrete

Exterior Description:
Constructed circa 1940, the Mercer County Sheriff's Office (Building A) is composed of a one-story-tall, side-gable main (northwest) block, a one-story-tall, side-gable, southeast (center) block, and a one-story-tall, shed-roof southeast wing (Plates 10–12). Metal ladders providing access to the roof are located in the northwest and southwest corners of the building. The building is primarily covered in corrugated metal sheets on both the roof and exterior walls. The five southernmost bays of the main block on the primary (southwest) elevation slightly project and are flanked by concrete parapet walls that connect to the base of the building. The first floor of this projection is parged in concrete, and the main entrance is located in the center bay and contains a metal door with glazing flanked by a single sidelight. Organized symmetrically within the projection, the windows are all metal fixed units. The second floor consists of a standing seam metal deck roof perforated by inset windows. The rest of the primary elevation on the main block is void of fenestration. The northwest elevation of the main block is asymmetrical with several secondary entrances and garage bays with metal roll-top doors in the eight westernmost bays. The four easternmost bays contain metal framed slider windows. A concrete loading dock lines the northeast elevation of the main block and is sheltered by a shed-roof overhang supported by metal square posts. The center block is void of fenestration except for a centered garage bay with a metal roll-top door on the northeast elevation. The southeast wing has an additional entrance, with a metal door, in the second westernmost bay of the southeast elevation. Windows on the southeast wing are all boarded shut and organized asymmetrically on the southeast and southwest elevations while the northeast elevation is symmetrical. The entire building stands atop a concrete foundation.

Interior Description:
Not accessible.

Setting:
The Mercer County Sheriff's Office (Building A) is located in the north section of the Trenton-Mercer Airport (Block 373, Lot 8.06). The building is bordered by Sam Weinroth Road to the north, Boeing Avenue to the east, and Grumman Avenue to the west. The two Maintenance Buildings (Building B and C) stand approximately 60 feet to the south and southwest, and the Substation (Building F) is situated approximately 75 feet to the east.

Common Name: Maintenance Building (Building B), Trenton-Mercer Airport
Historic Name: Vehicles Maintenance Shop and Public Works Shop, Mercer Field
Present Use: Unclassifiable Activities
Historic Use: Unclassifiable Activities
Construction Date: Circa 1942 **Source:** National Archives Catalog n.d.
Alteration Date(s): Mid-twentieth century **Source:** Stylistic evidence
Designer: Unknown **Physical Condition:** Good
Builder: United States Navy **Remaining Historic Fabric:** Medium
Style: Other
Form: Other **Stories:** 1
Type: N/A **Bays:** 16
Roof Finish Materials: Rubber Membrane
Exterior Finish Materials Concrete Block, Modern

Exterior Description:
The Maintenance Building (Building B) is a one-story-tall concrete block building constructed circa 1940 (Plates 13–15). It consists of a T-shaped footprint with a low-pitched, front-gable, two-bay-wide center block, flanked by flat-roofed, seven-bay-wide wings to the northwest and southeast, and a low-pitched, front-gable, two-bay-wide rear (northeast) wing. Windows are primarily two-over-two, wood-sash units grouped in pairs. The primary (southwest) elevation of the center block and side wings is asymmetrical with irregularly placed pedestrian entrances and garage bays. The pedestrian entrances contain metal doors, and the garage bays contain metal roll-top doors. Several of the garage bays and windows have been infilled with concrete block or boarded shut with wood paneling. The southeast elevation is asymmetrical and features a large, metal roll-top garage door in the southwest bay of the rear wing and a pair of wood doors in the northeast bay. The northwest wing has a symmetrical fenestration on its northwest elevation, and windows are boarded shut on the northwest elevation of the rear wing. Similar to the primary elevation, the rear elevation is asymmetrical with several garage bays and pedestrian entrances irregularly placed. Many of the windows and garage bays have also been infilled or boarded shut.

Interior Description:
Not Accessible.

Setting:
The Maintenance Building (Building B) is located in the north section of the Trenton-Mercer Airport (Block 373, Lot 8.02). It is bordered by Gruman Avenue to the east and East Piper Avenue to the south. Asphalt-paved parking lots line the building to the north and south providing vehicular access to the various garage bays. The Mercer County Sheriff's Office (Building A) is situated approximately 60 feet to the northeast, the Maintenance Building (Building C) is situated approximately 143 feet to the southeast, and the Signature Aviation Hangar (Building O) stands approximately 178 feet to the south.

Style:	Other		
Form:	Other	**Stories:**	1
Type:	N/A	**Bays:**	2
Roof Finish Materials:	Rubber Membrane		
Exterior Finish Materials	Concrete Block, Modern		

Exterior Description:
Constructed circa 1940, the Maintenance Building (Building C) is a one-story-tall, concrete block building made up of a two-bay-wide, front-gable main block, a northeast shed-roof wing, a circa-1965, side-gable southwest addition, and a circa-1990 southeast, shed-roof frame addition (Plates 16–18). Rubber membrane covers the roof throughout. The main block has an asymmetrical fenestration on the primary (southeast) elevation with a metal door in the easternmost bay. The rear (northwest) elevation is symmetrical. Windows on both elevations are metal replacement units with evidence that the windows were partially infilled to fit smaller units. Extending from the main block's northeast corner, the wing contains another entrance, with a metal door, centered on its northeast elevation. The circa-1965 addition is five bays wide with double-hung vinyl windows in the outermost bays and a primary entrance in the center bay. Flanked by wood fluted pilasters, the main entrance contains a vinyl door with glazing. The southwest elevation is asymmetrical with evidence of an infilled window in the northernmost bay. Another entrance, containing a metal door, is centered in the rear elevation. The circa-1990 addition is void of fenestration and appears to be an enclosed carport. The shed roof is supported by square columns with metal panels forming the exterior walls. The building has a concrete foundation.

Interior Description:
Not accessible.

Setting:
The Maintenance Building (Building C) is located in the north section of the Trenton-Mercer Airport (Block 373, Lot 8.04). It is located within a small triangle formed by Boeing Avenue to the east, East Piper Avenue to the south, and an asphalt-paved parking lot to the north. An Office Building (Building FF) stands approximately 40 feet to the east, the Mercer County Sheriff's Office (Building A) stands approximately 60 feet to the north, and the Maintenance Building (Building B) is situated approximately 143 feet to the northwest.

Form:	Other	**Stories:**	1
Type:	N/A	**Bays:**	5
Roof Finish Materials:	Rubber Membrane		
Exterior Finish Materials	Concrete Block, Modern		

Exterior Description:

Constructed circa 1940, the Maintenance Building (Building D) is a one-story-tall, concrete block building with an L-shaped footprint comprising a flat-roof, five-bay-wide main block and two flat-roof southwest additions (Plates 19–21). Rubber membrane covers the roof throughout. Windows are vinyl replacement units. The primary (southwest) elevation of the main block contains a centered garage bay with a metal roll-top garage door flanked by windows. The southern window is boarded shut. The rest of the main block's primary elevation is obstructed by the two additions. The northwest elevation has asymmetrical fenestration with entrances in the two center bays. The western entrance contains a metal door sheltered by a wood overhang and the eastern entrance is boarded shut. The fenestration of the main block's southeast elevation is symmetrical with a boarded shut window in the center bay and additional entrances, containing metal doors, in the outermost bays. All windows on the rear (northeast) elevation are boarded shut. Constructed circa 1955 and extended along the main block's primary elevation circa 1975, the additions have a garage bay in the southern corner of the primary elevation and two more garage bays are centered on the northwest and southeast elevations. The garage door on the southeast elevation is boarded shut and the other two contain metal roll-top doors. The building has a concrete foundation.

Interior Description:

Not accessible.

Setting:

The Maintenance Building (Building D) is located in the north section of the Trenton-Mercer Airport (Block 373, Lot 8.05). It is bordered by Lockhead Avenue to the east and Boeing Avenue to the west. The Garage (Building J) stands approximately 5 feet to the south, the Substation (Building F) stands approximately 50 feet to the north, and the Mercer County Sheriff's Office (Building A) and the Maintenance Building (Building C) are both approximately 150 feet to the west.

Exterior Description:
Constructed circa 1940, the Delaware Valley Radio Association (Building E) is a one-story-tall, concrete block building capped with a low-pitched, side-gable roof. (Plates 22 and 23). It has an L-shaped footprint with a northeast main block, a shed-roof southwest wing, and a late 1990s, shed-roof southwest addition. The main entrance is centered on the primary (northeast) elevation and contains a metal door with an aluminum storm door covered by a metal overhang. The northwest elevation of the main block is void of fenestration; however, a metal radio tower abuts the northern corner. The southeast elevation contains a centered window that has been boarded shut. Another entrance, containing a wood panel door, is placed off-center on the southeast elevation of the wing. Extending from the southwest elevation of the wing, the late 1990s addition is clad in vinyl siding and has asphalt shingles on the roof. It is accessed by a metal door centered on the southeast elevation and the southwest and northwest elevations are void of fenestration.

Interior Description:
Not accessible.

Setting:
The Delaware Valley Radio Association (Building E) is the westernmost building within the Trenton-Mercer airport complex (Block 373, Lot 1). It is set back approximately 210 feet northeast from Bear Tavern Road, 114 feet northwest of Control Tower Drive, and 38 feet southeast of Interstate 295. The Salt Dome (Building X) stands approximately 305 feet to the northeast.

Roof Finish Materials: Metal
Exterior Finish Materials Corrugated Steel

Exterior Description:
The Coventry Hangar (Building G) is a one-story-tall building topped with a front-gable roof (Plates 25 and 26). The exterior is completely clad in corrugated metal. The primary (west) elevation is symmetrical with a large aircraft bay that contains metal stacked slider doors with glazing. A metal pedestrian entrance is set within the two outer panels of the garage doors. The north, south, and rear (east) elevations have asymmetrical fenestration. Windows are generally fixed metal units or vinyl slider replacement units. The south and rear elevations feature a strip of metal ribbon windows near the roofline. Various pedestrian entrances, containing single and paired metal doors, and vehicular garage bays, containing metal roll-top doors, are irregularly placed on the north, south, and rear elevations. Most of the pedestrian entrances on the north and south elevations are sheltered by gabled, wood overhangs and contain single and paired metal doors with glazing.

Interior Description:
Not accessible.

Setting:
The Coventry Hangar (Building G) is the southernmost building within the Trenton-Mercer Airport complex (Block 373, Lot 5.01). It is surrounded by an asphalt-paved parking lot with a driveway connecting to the route of Jack Stephen Way approximately 210 feet to the east. A Fueling Station (Building Y) stands approximately 147 feet to the northeast, and the Johnson and Johnson Aviation Hangar (Building K) is located approximately 265 feet to the north.

Exterior Description:
Constructed circa 1963, the Air Traffic Control Tower (Building I) is a six-story-tall, three-bay-wide, one-bay-deep building topped with a flat roof (Plates 30 and 31). The rectangular base of the building is five stories tall and clad in corrugated metal with a metal railing bordering the roof line. The sixth floor contains the control room which features angled walls lined with metal framed ribbon windows. Windows on the base are a mix of three-light, metal framed units and grouped two-light metal-framed units. The main entrance, containing a metal door with glazing, is slightly off-center on the northwest elevation and covered by a flat, metal overhang. A full-height metal ladder is located west of the entrance. A secondary entrance is located in the center bay of the southwest elevation and contains a pair of metal doors with three lights. An additional entrance, containing a metal door, is located in the southernmost bay with an adjacent window. The southeast elevation is symmetrical, and the northeast elevation is asymmetrical.

Interior Description:
Not accessible.

Setting:
The Air Traffic Control Tower (Building I) is located near the center of the Trenton-Mercer Airport complex to the west of the runways (Block 373, Lot 7.03). An asphalt-paved parking lot is located to the east of the building with a small driveway wrapping around the north corner of the building to connect to the Lighting Equipment Room (Building M) which is located approximately 6 feet to the east of the control tower. The Luggage Building (Building HH) is situated approximately 510 feet to the west, the Trenton-Mercer Airport Terminal (Building S) is located approximately 615 feet to the southwest, and the Corporate Hangars (Building Z) are located approximately 450 feet to the northwest. The intersection of the runways is located approximately 987 feet to the east.

Designer: Unknown **Physical Condition:** Good
Builder: Unknown **Remaining Historic Fabric:** Medium
Style: Other
Form: Other **Stories:** 1
Type: N/A **Bays:** 4
Roof Finish Materials: Metal
Exterior Finish Materials Corrugated Steel

Exterior Description:
The Garage (Building J) is a one-story-tall, four-bay-wide, one-bay-deep, side-gable building constructed circa 1965 (Plates 32 and 33). It has a rectangular footprint, and the entire exterior of the building is clad in sheets of corrugated metal. The primary (southwest) elevation is symmetrical with two garage bays, both with metal roll-top doors, in the center bays and pedestrian entrances, containing metal doors, in the outermost bays. The southeast elevation has a centered garage bay, and the northwest elevation contains an off-center garage bay. Similar to the primary elevation, both garage bays contain metal roll-top doors. The rear (northeast) elevation contains a pedestrian entrance near the northern end.

Interior Description:
Not accessible.

Setting:
The Garage (Building J) is located in the north section of the Trenton-Mercer Airport (Block 373, Lot 8). It is bordered by Lockhead Avenue to the east, Boeing Avenue to the west, and East Piper Avenue to the south. A gravel parking lot abuts the west side of the building, and an asphalt-paved driveway extends from the southeast elevation to East Piper Avenue. A Maintenance Building (Building D) stands approximately 5 feet to the north, the East Hangars (Building N) stands approximately 60 feet to the east, a Storage Building (Building W) is approximately 20 feet to the southwest, and the Office Building (Building FF) is approximately 125 feet to the west.

Exterior Description:
Constructed circa 1966, the Johnson and Johnson Aviation Hangar (Building K) is a one-story-tall airplane hangar with an irregular footprint (Plates 34–36). It consists of a circa-1973 west main block and a circa-2018, front-gable east addition that is connected by a curved, circa-2018 north addition. The main block has a rectangular footprint and is capped with a flat roof that features angled metal framework. The primary (southeast) elevation contains an almost full-length aircraft bay with stacking metal slider doors. Three pedestrian entrances containing metal doors are inset within the larger slider door panels. The southwest elevation contains two pedestrian entrances near the center of the elevation. Both contain metal doors with a metal overhang sheltering the northernmost entrance. The rear (northwest) elevation of the main block contains two garage bays with metal roll-top doors separated by metal fixed windows in the western half. The eastern half of the rear elevation is obstructed by the north addition. The entire north addition is lined with Modern-style, curved metal ribs that merge into an overhang on the north corner. Below the overhang is a formal entrance containing metal glazed doors surrounded by metal-framed windows. The east addition contains another aircraft bay on its primary (southwest) elevation with metal slider doors. Two pedestrian entrances with metal doors are located in the corners of the southeast elevation with a metal roll-top garage bay adjacent to the northern entrance. Another pedestrian entrance and garage bay are located in the northern corner of the northwest elevation. The rear (northeast) elevation of the east addition is void of fenestration.

Interior Description:
Not accessible.

Setting:
The Johnson and Johnson Aviation Hangar (Building K) is located in the northern portion of the Trenton-Mercer Airport complex (Block 373, Lot 9.03). An asphalt paved parking lot surrounds the building and Scotch Road runs approximately 63 feet north of the building. The East Hangars (Building N) stand approximately 120 feet to the southwest.

Exterior Description:
The Vehicle Maintenance Building (Building L) is a one-story-tall, five-bay-wide rectangular building topped with a flat roof (Plates 37 and 38). A concrete block parapet wall lines the primary (northeast), northwest, and southeast sides of the roof. The exterior walls are constructed of concrete block and feature symmetrically spaced concrete block pilasters on each elevation. The southernmost bay of the primary elevation contains a metal pedestrian entrance and a multi-light, metal-framed window. Garage bays containing metal roll-top doors are located in the other four bays. The other three elevations are void of fenestration.

Interior Description:
Not accessible.

Setting:
The Vehicle Maintenance Building (Building L) is the northernmost building within the Trenton-Mercer Airport (Block 372.01, Lot 9). It is set back approximately 558 feet west of Scotch Road. A concrete parking lot abuts the northeast elevation of the building. The HomeFront Family Campus (Building H) stands approximately 83 feet to the southeast and the Gun Shed (Building V) is approximately 212 feet to the south.

Exterior Finish Materials Corrugated Steel

Exterior Description:
Built circa 1973, the East Hangars (Building N) consist of a circa-1973, front-gable northeast main block with flat-roof rear (northwest) and northeast wings, and a circa-1980, front-gable southwest addition with three shed-roof wings on its rear and southwest elevations (Plates 41–43). The entire building is clad in sheets of corrugated steel. Windows are fixed metal-framed units throughout. Large hangar doors, containing stacking slider doors are centered on the primary (southeast) elevations of both the main block and the addition, and metal pedestrian doors are symmetrically placed within the panels of the hangar doors. A central pedestrian entrance containing a glazed metal door is located in the northernmost bay of the addition. Secondary entrances are located on the northeast elevations of the two wings and contain paired metal-framed doors with glazing. A flat-roof overhang shelters the entrance on the rear wing. The circa-1980 addition has a garage bay centered on the rear elevation and a pedestrian entrance on the southwest elevation. Several more pedestrian entrances and garage bays are asymmetrically placed within the addition's shed-roof wings. They all contain metal roll-top garage doors and metal doors.

Interior Description:
Not accessible.

Setting:
The East Hangars (Building N) are located in the northern portion of the Trenton-Mercer Airport complex (Block 373, Lot 9.03). An asphalt-paved parking lot lines the southeast, northeast, and northwest elevations, and Lockhead Avenue borders the southwest elevation. The Johnson and Johnson Aviation Hangar (Building K) stands approximately 120 feet to the northeast, and the Garage (Building J) stands approximately 60 feet to the west.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
First established in 1942, the Trenton-Mercer Airport is a small mid-twentieth-century airport complex containing approximately 34 buildings and structures. Originally known as Mercer Field, the airport was initially used by the United States Navy for military aircraft testing during World War II. Following the war, the complex sat idle for seven years; however, after ownership of the airport was transferred back to the Mercer County Board of Freeholders, it was restored with plans to provide the greater Trenton area with public air service. As a result, several aircraft hangars and ancillary buildings were erected on the property throughout the second half of the twentieth century and were leased by large companies. Although several of the World War II era buildings were demolished during this time, some still stand on the property today and were repurposed. The airport became a joint civil-military public airport during the 1960s and was eventually renamed the Trenton-Mercer Airport by 1995. Overall the airport has been heavily altered over time to account for ongoing technological developments and changing needs of users and airport operations. During the late twentieth and early twenty-first centuries, many areas within the larger airport property have been subdivided and sold for private use and development.

CONTINUATION SHEET

Historic Sites #:

Additional Information, continued from Base Survey Form:
HDR, Inc. completed an Architectural Survey and Evaluation of Selected Facilities in 2015 and identified the Maintenance Hangar (Building R) and Vehicle Maintenance Shed (Building T) built by the New Jersey Army National Guard (NJANG) in 1976. Due to the buildings not being 50 years old and their lack of historic integrity, the survey recommended both buildings as not eligible for listing in the NRHP and suggested that they be reevaluated when they reached 50 years of age (HDR, Inc. 2015).

In July 2019, RGA conducted a Phase IA historical and archaeological survey and Reconnaissance-level historic architectural survey for proposed improvements to the Trenton-Mercer Airport. The survey identified five previously unevaluated architectural resources that were more than 50 years of age, including the mid-twentieth-century Air Traffic Control Tower, two mid-twentieth-century hangars, an early twentieth-century residence, and the mid-twentieth-century airport runway. The survey determined that the resources did not possess sufficient integrity or significance to warrant survey at the intensive level (RGA, Inc. 2019).

History:
Established during the early 1940s in Ewing Township, Mercer County, the Trenton-Mercer Airport was the second airport built in what is commonly known as the West Trenton area. The first airport, known as the Mercer Airport, was built during the late 1920s by the Mercer County Board of Freeholders and located to the northwest of the present-day airport complex, on the land now occupied by the Mountain View Golf Course (Block 372, Lots 1, 4, 5, 10–12). By October 1927, the Mercer Airport contained a primitive grass landing that was initially used by mail pilots (Trenton Evening Times [TET], 24 January 1928:9). Shortly after, the Mercer County Board of Freeholders committed to building a full-service airport and approved $50,000 for the effort (TET, 17 April 1928:1). A portion of the allotted funds was used to purchase the Hervey Scudder Farm along Bear Tavern Road, and in February 1929, the freeholders advertised for bids to construct the first aircraft hangar on the site to accommodate at least 10 airplanes, a mechanical shop, administration office, and gas station (TET, 1 February 1929:13). The Mercer Airport officially opened in August of that year in conjunction with Trenton's 250th anniversary with a dedication ceremony featuring an aerobatic demonstration that attracted 2,000 spectators (Tesauro 2002:25). By 1930, Mercer Airport offered personnel for servicing and maintenance, repair facilities, gas and oil, telephones, and meals (Airport Consultants, Inc 1930).

The old Mercer Airport continued to operate until the early 1940s; however, three months after the United States entered World War II, it was determined that the Mercer Airport was not big enough to accommodate military aircraft activity. This led to the Mercer County Board of Freeholders announcing plans to construct a new airfield immediately southeast of the existing airport and set the foundation for the present-day Trenton-Mercer Airport. Originally known as Mercer Field, the three intersecting runways were built by the Civil Aeronautics Board in 1942 (TET, 9 March 1949:1). Essential buildings such as hangars and barracks were built by the federal government before the airfield was officially commissioned by the United States Navy in July 1943 to operate as the Naval Aircraft Delivery Unit (Stell Environmental Enterprises, Inc. 2013:5-3). An early 1940s *Map of Mercer Field* depicts the naval facilities built in the north section of the airport complex which included a total of 39 buildings and structures, a few of which were repurposed and are still extant today. The remaining Naval buildings include: the Main Storehouse (Building A), the Vehicles Maintenance Shop and Public Works Shop (Building B), the Welding Shop (Building C), and the Paint Chemical Storage and Photo Lab (Building D) (Figures 1 and 2; National Archives Catalog n.d.). The old Mercer Airport was officially closed in March 1942 (Reilly 1997:110).

Not long after the establishment of Mercer Field, the General Motors (GM) Ternstedt plant, located south of Parkway Avenue along the southern terminus of the airfield, was incorporated into GM's Eastern Aircraft Division. The Ternstedt plant was initially used to manufacture automobile hardware but, in 1941, the plant was shut down by the government to curtail the use of vital war materials. Shortly after, the Eastern Aircraft Division was formed, and GM converted the plant into an aircraft factory to support the war effort and to test aircrafts for the United States Navy (TET, 3 March 1942:11). During the war, 7,500 Avenger torpedo bombers were produced at the GM Ternstedt plant

CONTINUATION SHEET

History, continued:

and then tested at Mercer Field for military service (TET, 23 January 1955:13). A photograph taken in front of the circa-1940 west hangar commemorated the 10,000th airplane commissioned at Mercer Field (Figure 3; National Archives Catalog n.d.). Eventually, the Navy would go on to test more than 15,000 planes at the airfield (TET, 23 January 1955:13).

By the end of World War II, the 1945 AAF Airfield Directory described the Mercer Airport as a 305-acre property having two sod runways and three hangars, although "not in operation" (Freeman 2019). Following the war, the housing shortage led to discussions of using the naval barracks on the property for Veteran housing; however, it is unclear whether or not the empty facilities were actually used (TET, 11 December 1945:1). In 1947, the Mercer County Freeholders requested that the government return ownership of Mercer Field, along with "all its buildings, land, facilities, and equipment," so that air service could be provided to the greater Trenton area (TET, 22 October 1947:2). Although the Mercer County Freeholders did not have ownership at the time, they began looking to lease the airport facilities to a large company that would manage the airfield and provide adequate service to the surrounding community (TET, 22 October 1947:2). It was also during this time that the Navy informed the Mercer County Board of Freeholders that it planned to build a test facility on the 74-acre parcel adjacent to Mercer Field along Parkway Avenue. The site was designated as the Naval Aeronautical Turbine Test Station (NATTS) and officially opened on November 4, 1955. For the next several decades, the laboratory, located southeast of the airport, was in full operation and later played an integral role in the development of military technology during the Cold War (Louis Berger & Associates, Inc. 1996; NETR 1953).

Preparations for turning Mercer Field into a commercial airport began in 1949 with ownership and maintenance of Mercer Field still in discussion between the County and the federal government (TET, 9 March 1949:1). The airport was not used for seven years, and, during this time, the runways and facilities sat idle and were not well maintained. It was not until 1952 that the Department of Defense and the Navy canceled the lease on the airfield and the government finally surrendered the facility back to the Mercer County Board of Freeholders (TET, 21 September 1947:9, 23 March 1949:1, 10 January 1952:3). Although the Navy cancelled their lease on the airfield, a new 20-year lease was drafted for "all Navy-owned property north of Ridge Road known as the barracks area" (Stell Environmental Enterprises, Inc. 2013:5-3).

During the early 1950s, the County saw Mercer Field as an opportunity to encourage industrial growth in the area. In August 1952, Chase Aircraft signed a 99-year lease for 54 acres of land within the airport in the empty section near Bear Tavern Road. They began plans to build "several work hangars and added office space" (TET, 22 August 1952:1). A 1953 historic aerial suggests that Chase Aircraft likely built the hangar building (no longer extant) shown approximately 1,950 feet northeast of Bear Tavern Road along present-day Sam Weinroth Road (Figures 4a and 4b; NETR 1953). In an attempt to turn the airport back into a civilian enterprise, Mercer County Freeholder John E. Curry worked with Allegheny Airlines to offer flights to the general public. In 1955, civilian commercial passenger service began at Mercer Field and within just three years, the airport had hosted 30,000 private and commercial flights (Trenton Sunday Times-Advertiser, 26 April 1959:1). Several buildings were constructed within the airport complex during the 1950s, including the Substation (Building F), the Coventry Hangar (Building G), and the present-day HomeFront Family Campus building (Building H) which was originally built around 1955 as a Naval Communications Unit during the Cold War and then repurposed into the "Naval Communications Unit No. 11" in 1957 for the former Inspector-Instructor West Trenton Facility (Stell Environmental Enterprises, Inc. 2013:5-3; NETR 1953, 1957).

By the 1960s, the conversion of Mercer Field into a modern air center was well underway, and a county publication for the Tercentenary Commission reported several improvements completed by the County. The improvements included extending the runways, the construction of a new control tower, and installment of an all-weather instrument-landing. In addition to the new Air Traffic Control Tower (Building I), two additional buildings were constructed during the 1960s, including a Garage (Building J) and the building that currently houses the Johnson and Johnson Aviation Hangar

CONTINUATION SHEET

Historic Sites #:

History, continued:
(Building K). It was also during this time that the airport name was changed for the first time to Mercer County Airport (Gemmell and Havens 1964). In 1969, a fire broke out at the airport, leveling a large hangar and the Allegheny Airlines waiting room and office and the airport restaurant. Multiple aviation fleets were destroyed, causing damage exceeding $3 million (TET, 15 April 1969:3). After Allegheny Airlines threatened to withdraw flights, the county began constructing a temporary terminal, consisting of two trailers and an 800-foot runway extension in 1970 (TET, 27 January 1970:50). Most of the early-1940 naval buildings were demolished in the late 1960s and 1970s (NETR 1969, 1971, 1979).

The current Trenton-Mercer Airport Terminal (Building S) was completed in 1976 (NETR 1979; TET, 8 January 1975:31). That same year, the New Jersey Army National Guard constructed the maintenance hangar and army aviation support facilities (Building R) east of the runways to the west of Scotch Road's intersection with the railroad (HDR, Inc. 2015). The facility was developed as a heliport and continues to be used by the New Jersey Army National Guard today (HDR, Inc. 2015:26). By 1979, the smallest and westernmost runway that abutted the new airport terminal was converted into a taxiway and seven more buildings were erected within the airport complex, including the Vehicle Maintenance Building (Building L), a Garage (Buildings T), the Lighting Equipment Room (Building M), the East Hangars (Building N), the Signature Aviation Hangar (Building O), and two circa-1975 Hangars (Buildings P and Q) (Figure 5; NETR 1979). Development within the airport complex continued throughout the late twentieth century with the Fire Station (Building U), a Gun Shed (Building V), a Storage Building (Building W), the Salt Dome (Building X), the Fueling Station (Building Y), and some of the Corporate Hangars (Building Z) (NETR 1995). The county-owned airport officially became the Trenton-Mercer Airport in 1995.

During the twenty-first century, several more Corporate Hangar buildings (Building Z) were erected and the Pfizer, Inc. Hangar (Building AA), the Trenton Corporate Air Wing Hangar (Building BB), two garages (Buildings CC and GG), a Utility Building (Building DD), a Hangar (Building EE), and the Office Building (Building FF) were all constructed by 2010 (NETR 2002, 2004, 2006, 2007, 2008, 2010). Around 2011, the former Chase Aircraft building was demolished and turned into a parking lot (NETR 2010, 2012). Sometime around 2015, the former Naval Communications Unit No. 11 (Building H) was drastically renovated to its current appearance and function as the HomeFront Family Campus (Stell Environmental Enterprises, Inc. 2013). The most recent building erected within the complex is the Luggage Building (Building HH), which was constructed around 2014. It is located just north of the Trenton-Mercer Terminal Building (Building S). Presently, Trenton-Mercer Airport is a joint civil-military public airport.

Justification of Eligibility/Ineligibility:
The Trenton-Mercer Airport complex is recommended not eligible for listing in the National Register of Historic Places (NRHP). Although the airport played a large role in the testing of military aircraft during World War II and contained a Communications Building for the Cold War, many of the buildings dating to this time period were demolished or altered to suit modern uses. Furthermore, research did not find that subject property was associated with any important individuals. Architecturally, the Trenton-Mercer Airport contains several buildings constructed between 1942 and 2014; however, they are all common and unremarkable examples of their types and not the work of a master. Overall, the mid-twentieth-century airport complex retains a high degree of historic integrity in terms of location, but removal of and alterations to the World War II era buildings and the construction of several new commercial aircraft hangars and ancillary buildings during the second half of twentieth century has effectively diminished the complex's integrity of feeling, setting, materials, design, and workmanship. For these reasons, the Trenton-Mercer Airport complex is recommended not eligible for listing in the NRHP.

Local Place Name(s): West Trenton **Lot(s):** 3, 4.02

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

First developed in 1942, the Aeronautical Turbine Laboratory/Naval Air Warfare Center Aircraft Division-Trenton (ATL/NAWCAD-Trenton) Complex is situated on an approximately 56-acre property at 1500 Parkway Avenue in Ewing Township, Mercer County, New Jersey (Plates 1–18). The property is bounded by Parkway Avenue to the south, the Delaware and Bound Brook (Reading) Railroad Historic District (SHPO Opinion: 9/9/2005), presently known as SEPTA's West Trenton Line, to the east, and the Trenton-Mercer Airport to the north and west. *See Historic District Overlay*

Other Designation Date:

Description, continued from Base Survey Form:

At the height of its operations, the ATL/NAWCAD-Trenton Complex had over 25 buildings and structures on the property. Developed in two distinct phases, the first buildings on the property were constructed during the 1940s by General Motors to support their Eastern Aircraft Division manufacturing operations during World War II. The second phase of development occurred after the war, when the Navy acquired the 56-acre property in the late 1940s with plans to build an aeronautical testing and research facility. Between 1953 and 1955, the three main buildings of the aeronautical research and testing facility were erected: the Blower Wing, the Test Wing, and the Exhauster Wing. These three buildings, along with a few remaining ancillary structures, currently make up the National Register of Historic Places (NRHP)-eligible Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996). The complex continued to operate as a testing facility until 1993, when it was disassembled and relocated. Today, the ATL/NAWCAD-Trenton Complex is being redeveloped and several buildings have been removed or are in the process of being demolished. There were approximately 13 buildings left standing at the time of this survey.

Setting:

Located in the West Trenton portion of Ewing Township, Mercer County, the ATL/NAWCAD-Trenton Complex is surrounded by the Trenton-Mercer Airport to the northwest and a mix of industrial, commercial, and residential properties. Consisting of several parcels (Block 374, Lots 3, 4.01, 4.02, 5.01, and 9.90), the complex is surrounded by chain link fences and dense vegetation.

BUILDING/ELEMENT ATTACHMENT

Historic Sites #:

☒ **BUILDING** ☐ **STRUCTURE** ☐ **OBJECT**

Common Name: Storehouse A
Historic Name: Storehouse (No. 31)
Present Use: No Activity
Historic Use: Unclassifiable Activities
Construction Date: 1944 **Source:** Louis Berger & Associates, Inc. 1996
Alteration Date(s): Unknown **Source:** Unknown
Designer: Unknown **Physical Condition:** Poor
Builder: General Motors **Remaining Historic Fabric:** Low
Style: None
Form: Other **Stories:** 1
Type: N/A **Bays:** N/A
Roof Finish Materials: Unknown
Exterior Finish Materials Concrete Block, Modern

Exterior Description:
Constructed in 1944, Storehouse A is a one-story-tall building composed of a center block flanked by shorter, one-story-tall wings to the northeast and southwest and a one-story-tall, northeast addition (see Plate 6). The center block has a flat roof encompassed by a parapet wall with metal coping. A large off-center, interior brick chimney pierces the north edge of roof, and a metal ladder provides exterior access to the roof on the east corner of the south elevation. The primary (southeast) elevation has an asymmetrical fenestration with the main entrance located in the southernmost bay. Located near the southern corner of the elevation is a pair of metal doors with glazing. Wood clapboard siding is located above the doors indicating that a larger doorway was infilled. The rear (northwest) elevation is asymmetrical with a metal, double-hung window located in the northernmost bay and a secondary entrance located in the southernmost bay. Both bays are partially infilled with wood clapboard siding.

The flat-roofed northeast wing spans the full length of the main block. The northwest elevation has a pair of metal doors in the easternmost bay and a pair of windows in the westernmost bay while the southwest elevation contains a boarded shut window. Extending from the northeast elevation of the wing, the northeast addition has a shed roof covered in asphalt shingles. It contains an entrance on the northwest elevation, and a pair of vinyl windows and vinyl siding are located on the southwest elevation. The southwest wing is severely deteriorated; however, evidence of the flat metal roof and corrugated metal siding is still visible.

Interior Description:
Not Accessible.

Setting:
Storehouse A is located in the northwest corner of the parcel (Block 374, Lot 4.02) and set back 70 feet east of Jack Stephen Way. Storehouse B stands approximately 28 feet to the east and the Water Treatment Plant and Industrial Water Treatment Plant buildings are approximately 80 feet to the southeast. An outbuilding situated outside of the complex's fence (Block 374, Lot 3) is located approximately 36 feet to the southwest.

BUILDING/ELEMENT ATTACHMENT

Builder: General Motors **Remaining Historic Fabric:** Low
Style: None
Form: Other **Stories:** 1
Type: N/A **Bays:** N/A
Roof Finish Materials: Unknown
Exterior Finish Materials Concrete Block, Modern

Exterior Description:
Constructed in 1944, Storehouse B is a one-story-tall concrete block building topped with a flat roof (see Plate 7). A partially collapsed, full-length, shed-roof frame addition lines the southeast elevation and is clad in aluminum siding. The main entrance is centered on the primary (northeast) elevation and consists of a metal door with glazing. A secondary entrance is placed off-center on the primary elevation of the addition and contains another metal door with glazing. The northwest elevation of the main block has an asymmetrical fenestration with evidence of a wood framed window in the northernmost bay. The southeast elevation of the addition is void of fenestration. The rear (southwest) elevation was not visible.

Interior Description:
Not Accessible.

Setting:
Storehouse B is located near the northwest corner of the parcel (Block 374, Lot 4.02) and set back 135 feet east of Jack Stephen Way. Storehouse A stands approximately 28 feet to the west and the Water Treatment Plant is approximately 90 feet to the south.

BUILDING/ELEMENT ATTACHMENT

Type: N/A **Bays:** 1
Roof Finish Materials: Unknown
Exterior Finish Materials Concrete Block, Modern

Exterior Description:
Water Pumphouse A was constructed in 1944 and is a one-story-tall, concrete block building with what appears to be a shed roof (see Plate 8). The primary (northeast) elevation has a centered entrance with no door and a window is centered on the southeast elevation. The northwest elevation is void of fenestration and the rear (southwest) elevation was not visible.

Interior Description:
Not Accessible.

Setting:
Water Pumphouse A is located near the north border of the parcel (Block 374, Lot 4.02). A water treatment tank abuts the northwest elevation. Storage Building A stands approximately 27 feet to the northeast, the Cooling Tower is located approximately 36 feet to the southwest, and the Industrial Water Treatment Plant and Water Treatment Plant buildings are approximately 70 feet to the northwest.

Historic Sites #:

☒ **BUILDING** ☐ **STRUCTURE** ☐ **OBJECT**

Common Name:	FlightServ Aircraft Hangar		
Historic Name:	Public Works Office and Shops (No. 34)		
Present Use:	No Activity		
Historic Use:	Industrial Activity – Research and Development		
Construction Date:	1944 **Source:**	Louis Berger & Associates, Inc. 1996	
Alteration Date(s):	Circa 1955, Circa 2020 **Source:**	NETR 1953, 1957, 2019, 2022	
Designer:	Unknown	**Physical Condition:**	Good
Builder:	General Motors	**Remaining Historic Fabric:**	Medium
Style:	None		
Form:	Other	**Stories:**	1
Type:	N/A	**Bays:**	N/A
Roof Finish Materials:	Metal		
Exterior Finish Materials	Corrugated Steel		

Exterior Description:

The FlightServ Aircraft Hangar is a one-story-tall building consisting of a front-gable main block, a west wing, a circa-1955 southwest addition, and a circa-2020 north addition (see Plates 9–11). The main block makes up a majority of the building's mass and is clad in corrugated metal siding. Windows are primarily fixed, metal ribbon units situated near the roof line and organized symmetrically on the southwest elevation and asymmetrically on the northwest and southeast elevations. The primary (northeast) elevation has symmetrical fenestration and features two large aircraft bays with sliding doors flanked by pedestrian entrances containing metal doors and glazing. Two more pedestrian entrances are located in the outer bays of the southeast elevation. The west wing is capped with a metal hipped roof and extends along the entire length of the main block's northwest elevation and wraps around the corner to the southwest elevation. It is clad in metal siding with stone veneer below the windows. The circa-1955 southwest addition abuts the wing and extends along the rest of the main block's southwest elevation. It has a metal shed roof and is sheathed in metal corrugated siding throughout. The north four bays of the circa-1955 addition project outward and contain two off-center garage bays with metal roll-top doors flanked by metal pedestrian entrances. Several more irregularly placed entrances, containing single and paired metal doors with glazing, line the southwest elevation of both the wing and addition with metal overhangs sheltering the entrances on the wing. Windows are fixed metal units throughout. *See Continuation Sheet*

Interior Description:

Not Accessible.

Setting:

The FlightServ Aircraft Hangar is the northernmost building of the ATL/NAWCAD-T complex and is located on a separate parcel with the Jet Fuel Storage Tanks and Test Fuel Pumphouse (Block 374, Lot 4.01). The building is surrounded by a large asphalt-paved parking lot that connects to the northern terminus of Jack Stephen Way, approximately 255 feet to the west. An airplane runway extends from the north corner of the parking lot and connects to the runways of the Trenton-Mercer Airport. Storehouse B and Storage Building A are located approximately 170 feet to the southwest. The Jet Fuel Storage Tanks and Test Fuel Pumphouse are situated approximately 500 feet to the southeast.

Builder: Unknown **Remaining Historic Fabric:** Low
Style: None
Form: Other **Stories:** 1
Type: N/A **Bays:** 1
Roof Finish Materials: Asphalt Shingles
Exterior Finish Materials Brick, Common Bond

Exterior Description:
The Outbuilding is a one-story-tall brick building constructed circa 1950 (see Plate 12). Although severely deteriorated, the building has a gable roof with evidence of asphalt shingles. The exterior walls are brick laid in the common bond with ventilation holes in the gable peaks and under the eaves. The building is void of fenestration; however, there is evidence of an infilled door centered on the southeast elevation and an infilled window near the south corner of the southwest elevation.

Interior Description:
Not Accessible.

Setting:
The outbuilding is located near the northwest corner of the complex on a separate parcel (Block 374, Lot 3). Standing just outside of the complex's fence, the outbuilding is set back approximately 35 feet east of Jack Stephen Highway. Dense vegetation surrounds the building to the east and south. Storehouse A stands approximately 36 feet to the northeast and the Industrial Water Treatment Plant is located approximately 90 feet to the southeast.

Exterior Finish Materials	Brick, Common Bond		

Exterior Description:
Constructed circa 1950, the Industrial Water Treatment Plant is a rectangular, two-story-tall brick building with a raised walking platform extending from the center of the southeast elevation over a rectangular water treatment tank (see Plate 14). The main block is topped with a flat roof encompassed by a brick parapet wall. An interior staircase provides access to the roof in the northeast corner and consists of a one-story corrugated metal box with a boarded-shut door placed off-center on the west elevation. Due to dense vegetation, view of the building's elevations was not possible from the public right-of-way.

Interior Description:
Not Accessible.

Setting:
The Industrial Water Treatment Plant is located near the north corner of the parcel (Block 374, Lot 4.02). The Water Treatment Plant is located approximately 14 feet northeast, the Cooling Tower 28 feet to the south, the Pumphouse approximately 30 feet to the west, and the Water Pumphouse A approximately 70 feet to the southeast.

Additional Information:
The Aeronautical Turbine Laboratory Historic District (SHPO Opinion: 3/28/1996) was first identified in 1996 in a cultural resources survey of the Naval Air Warfare Center, Aircraft Division (NAWCAD) in Trenton, New Jersey conducted by Louis Berger & Associates, Inc. Due to many of the buildings being under 50 years of age during the time of the survey, only the three main laboratory buildings within the Aeronautical Turbine Laboratory property were recommended eligible for listing in the NRHP under Criteria A and C and Criteria Consideration G (Louis Berger & Associates, Inc. 1996:50–52). As a result of the survey, the complex was determined to be eligible for listing in the NRHP, and, in January 1998, Louis Berger & Associates, Inc. documented the property to the standards of the Historic American Engineering Record (HAER) (Louis Berger & Associates Inc. 1998). The HAER survey included measured drawings and a history of the property.

Exterior Description, continued from Building/Element Attachment: FlightServ Aircraft Hangar:
The circa-2020 addition is two-stories-tall and extends from the north corner of the main block. It features Modern design elements including a tilted, segmental-arch metal roof and large, fixed metal windows that wrap around the west corner on both floors. The exterior is clad in metal siding. A formal entrance to the building is angled on the southwest elevation and is sheltered below an arched metal porte-cochere that extends into the parking lot. Stone veneer square columns flank the main entrance vestibule which has a flat roof and contains metal sliding doors. The northwest elevation features stone-veneer pilasters between each bay with another entrance, containing a pair of metal doors with glazing, in the center bay. The second story has a full-length balcony that wraps around to the southeast corner and is sheltered by an overhang of the arched roof. Access to the balcony is provided by three, symmetrically placed entrances. All of the entrances contain single or paired metal doors with glazing.

History:
The Aeronautical Turbine Laboratory/Naval Air Warfare Center Aircraft Division-Trenton (ATL/NAWCAD-Trenton) complex is located at 1500 Parkway Avenue, Ewing Township, Mercer County. Before being redeveloped and designed to test aircraft propulsion systems for the United States Navy, the subject property was first purchased by General Motors, an automotive manufacturing company, during the early 1940s. In an effort to expand their operations to the east coast, General Motors initially purchased 86 acres on the south side of Parkway Avenue and quickly built a 7,000-square-foot manufacturing plant that historically stood at present day 1401–1499 Parkway Avenue (Block 1102, Lot 1) (Trenton Evening Times [TET], 23 January 1955:13).

Known as the Ternstedt Plant, it was initially used to manufacture sets of automobile hardware, including hinges, door locks, trim, and window regulators; however, in 1941, the plant was shut down by the government to curtail the use of vital war materials during World War II. Shortly after operations were shut down, General Motors established the Eastern Aircraft Division and converted the plant into an aircraft factory that produced the carrier-based Grumman Avenger torpedo bomber for the Navy (Louis Berger & Associates, Inc. 1998:13). In 1942, the plant was expanded when General Motors acquired a 74-acre parcel on the north side of Parkway Avenue flanking both sides of the Reading Railroad and including the subject property (Block 374, Lots 3, 4.01, and 4.02). Abutting both Mercer Field and the Reading Railroad, the land was in an ideal location to test the military aircraft being produced and meet the transportation needs of wartime manufacturing.

Shortly after purchasing the subject property, General Motors began the first phase of development (1942–1948) by constructing several buildings to assist in the war efforts. The General Motors buildings included the Public Works Office and Shops (presently known as the FlightServ Aircraft Hangar), the Fluid Test Facilities Building, the Auxiliary Shop Wing, and a large warehouse (Figure 1; NAWCAD-Trenton News 1998:8). Used to store war materials, the Auxiliary Shop Wing and warehouse were connected by a covered railroad spur that ran along their north elevations and provided cover and secrecy for unloading railcars (NETR 1949). In addition to constructing the buildings on the subject property, General Motors also built their Administration Building, which stood on the opposite side of the Reading Railroad at present-day 1460–1480 Parkway Avenue (Block 365, Lots 9.01 and 9.02). During the war, 7,500

CONTINUATION SHEET

Historic Sites #:

History, continued:

Avenger torpedo bombers were produced at the Ternstedt plant and were tested at Mercer Field for military service (TET, 23 January 1955:13).

Two years after World War II ended, in 1947, the Navy announced their intentions to build a test facility in West Trenton, likely due to the onset of the Cold War between the United States and the Soviet Union. Prior to World War II, aircraft experimentation with gas turbine engines was advancing and would eventually lead to the creation of the jet engine. Following the war, the field of aerodynamics continued to rapidly progress, and the United States military required more advanced testing facilities to further research and develop their aircrafts (Louis Berger & Associates, Inc. 1998:14–15). The proposed Aeronautical Turbine Laboratory (ATL) was to be constructed on the west side of the railroad on the 56 acres making up the subject property (Louis Berger & Associates, Inc. 1998:19). Designs for the ATL began in November of that year, and two years later, in 1949, bids were accepted for the construction of a proposed shop building, river pumping station, boiler house, and other buildings within the complex (TET, 14 July 1949:1). The construction contract was given to the Belli Company of Trenton (Louis Berger & Associates, Inc. 1998:19).

Before construction began, the large warehouse built by General Motors was removed from the property to make room for the proposed ATL facilities. The Public Works Office and Shops, Fluid Test Facilities Building, and Auxiliary Shop Wing were all left standing and likely repurposed (NETR 1953). In 1951, the ATL was formally designated as the Naval Air Turbine Test Station (NATTS); however, the actual engine testing area continued to be referred to as the ATL (Louis Berger & Associates, Inc. 1998:2). The ATL was designed by the Newark-based architectural firm Frank Grad and Sons along with the help of two New York City-based engineering firms, Jaros, Baum & Bolles and Burns and Roe.

After the construction of the ATL began in 1951, it was quickly apparent that advancements in gas turbine engines led to them increasing in size and capacity and that the airflow capacity of the laboratory as designed would not be sufficient. As a result, it was "determined that to meet future test requirements the facility should consist of two large altitude chambers, an additional turboprop cell, an instrument test wing, an accessories test wing, two sea-level cells, a fourth ram blower, an altitude test stand, a projects operations building, and a dynamometer for the existing turboprop cell" (Louis Berger & Associates, Inc. 1998:20). Due to the complex nature of the facility, the ATL was precisely laid out so that the interactions between the three main buildings, consisting of the Blower Wing, Test Wing, and Exhauster Wing, could efficiently interact. As such, the three buildings were organized parallel to each to allow for the piping systems to flow in a nearly straight line and to prevent any unnecessary resistance and turbulence within the airstream (Figures 2 and 3; Louis Berger & Associates, Inc. 1998:3; TET, 7 April 1955:2; Naval Air Propulsion Test Center [NAPTC] 1975).

A 1952 birds eye view of the complex shows the construction of the ATL and the presence of the Boiler House along the eastern border of the property (Figure 4; NAWCAD-Trenton News 1998:9). Just two years later, in 1954, the ATL was close to completion with progress being shown in another birds eye view image from that year (Figurer 5; NAPTC 1969). The dedication ceremony for the ATL was held by the Navy on November 4, 1955, and, at the time of its opening, the laboratory was considered the most complex engine test in existence (Central New Jersey Home News, 4 November 1955:22; TET, 2 July 1951:1). For the first two years, between 1955 and 1957, the station performed engine tests to evaluate and fine-tune the plant equipment (Louis Berger & Associates, Inc. 1998:22). In 1957, full-scale testing began on the largest and most powerful engine at the time, the Pratt & Whitney J-75 engine, which quickly indicated that a larger and more powerful test cell would be needed. As a result, the engineering firm of Kelly and Gruzen was selected to design the third altitude test chamber and an additional ram blower. Construction of the new test chamber began in January 1958 by two New York City-based construction companies: the Malan Construction Corporation and the Dean Construction Company, Inc (Louis Berger & Associates, Inc. 1998:23).

By the late 1950s the laboratory was in full operation and consisted of approximately 25 buildings and structures. In addition to the three remaining General Motors buildings and the main ATL buildings, the complex also included a main gatehouse, a shop building, two water treatment plants, three water pumphouses, a cooling tower, a fire headquarters, a test fuel pumphouse, a pumping station, a water tower, and several storage buildings (Figure 6; NETR

CONTINUATION SHEET

Historic Sites #:

History, continued:
1957). The 1960s was a busy decade with the facility testing 27 different engine types and making major contributions to the development of military technology for the ongoing Cold War (Louis Berger & Associates, Inc. 1996). Around 1965, the Fuel Control Facility was constructed to the northwest of the Blower Wing (NETR 1963, 1967).

The establishment of the Naval Air Systems Command in 1967 led to the Navy's Philadelphia-based Aeronautical Engine Laboratory (AEL) merging with the ATL in West Trenton (Louis Berger & Associates, Inc. 1998:10, 23). The merger between the two facilities spanned eight years and eventually led to the ATL facility being renamed the Naval Air Propulsion Test Center in 1975. As a result of the merger, Trenton's testing capabilities were expanded to include turboprop and turboshaft engines, and included facilities for small engine development and testing, fuels and lubricants testing, accessories testing, and a rotor spin-test chamber (Louis Berger & Associates, Inc. 1998:23). Two years later, in 1977, the name of the facility was changed again and slightly simplified to the Naval Air Propulsion Center (Louis Berger & Associates, Inc. 1998:24). Likely built to accommodate the new equipment from the merger, a Turbo Compressor addition was constructed on the southeast elevation of the Blower Wing by 1979 (Figure 7; NETR 1979).

During the last two decades of the twentieth century, several more ancillary buildings were erected on the property, including a Lumber Shed, Transfer Station, a Dissolved Air Flotation Facility, a Chlorination Building, an additional Pumphouse, a Storage Shed, and a Garage (Figures 8 and 9; NAWCAD-Trenton News 1998:1; NETR 2002). The Cooling Towers were also reconstructed during the early 1980s (Louis Berger & Associates, Inc. 1996:30). It was not until 1991 that the facility was given its final name, the Naval Air Warfare Center Aircraft Division-Trenton (NAWCAD-Trenton) (Louis Berger & Associates, Inc. 1998:2). A few more buildings were erected on the property during the late twentieth century including a circa-1990 garage to the west of the Test Wing and several modern sheds.

During the early 1990s, the Base Realignment and Closure Commission determined that the studies performed at NAWCAD-Trenton could be more efficiently conducted at other military facilities. This led to the transfer of the propulsion engineering function to the NAWCAD in Patuxent River, Maryland, and the large engine altitude testing function to the Air Force Arnold Engineering Development Center in Tullahoma, Tennessee (Louis Berger & Associates, Inc. 1998:24). By September 1998, the disassembling of NAWCAD-Trenton was well underway and demolition and environmental cleanup operations were in progress. The facility closed permanently in December 1998 (Louis Berger & Associates, Inc. 1998:24). Around 2009, the Boiler House was demolished; however, the other buildings remained until selective demolition began in 2020. As of August 2024, only 13 buildings remained on the property, including the Test Wing, Blower Wing, the FlightServ Aircraft Hanger (former Public Works Office and Shops), two water treatment plant buildings, three storage buildings, the Test Fuel Pumphouse, the Fuel Control Facility building, a water pumphouse, and an outbuilding; the Exhauster Wing was in the process of being demolished.

Significance:
Although no longer in operation, the ATL/NAWCAD-Trenton Complex was constructed in two phases of development spanning from 1942 to its closure in 1998. The earliest buildings on the property were constructed by General Motors during the 1940s to support their West Trenton-based naval aircraft manufacturing plant during World War II. Following the war, in 1949, ownership of the property was transferred to the United States Navy and ground was broken for the second phase of development which included the construction of the ATL. At the time of its completion during the mid-1950s, the ATL "was reportedly the most powerful and [technologically] advanced aircraft gas-turbine engine test facility in the world" (Louis Berger & Associates, Inc. 1998). Even after its completion, the ATL was continuously developed and improved to accommodate the rapid advancements made in aeronautical technologies during the mid-twentieth century. Overall, the studies done at the ATL made vital contributions to aeronautical engineering, safety, and aviation science "by gathering empirical data and then establishing aircraft industry standards governing the performance of engines, lubricants, and fuels" (Louis Berger & Associates, Inc. 1998). These studies ultimately led to notable advancements in the United States' military jet-engine technology during the Cold War military-arms race. At the height of its operations the complex consisted of over 25 buildings and structures. Slated for redevelopment, the property is currently in the process of being demolished.

CONTINUATION SHEET

Historic Sites #:

Justification of Eligibility/Ineligibility:

In 1996, the Aeronautical Turbine Laboratory Complex Historic District (SHPO Opinion: 3/28/1996) was determined eligible under Criteria A for its significant role in the testing of aircraft engine performance in the Post-World War II period and its important contributions to the United States military technology advancements during the Cold War. Constructed between 1953 and 1957, the three main ATL buildings were deemed to represent a major achievement of mid-twentieth-century engineering and to be exceptionally well-preserved examples of their type, meeting Criterion C (Guzzo 1996). At the time, the historic district contained eight contributing buildings and structures, including the Exhauster Wing, Test Wing, Blower Wing, a Water Pumphouse, the Fuel Control Facility, and three unknown structures. One of the contributing unknown structures was demolished around 2004, and the original ATL testing facilities have been left vacant since 1998. The remaining contributing resources are currently in the process of the being demolished. The removal of the contributing resources drastically diminishes the historic district's integrity of design, materials, and workmanship.

Prior to the demolition of several buildings on the larger ATL/NAWCAD-Trenton Complex, it would have been recommended to expand the Aeronautical Turbine Laboratory Complex Historic District boundaries to encompass the entirety of Block 374, Lots 3, 4.01, 4.02, 5.01, and 9.90. The ATL/NAWCAD-Trenton Complex would have been recommended to be eligible under Criterion A for its associations with aeronautical technology advancements following World War II and during the Cold War and under Criterion C as a well-preserved collection of mid-twentieth-century industrial buildings built by the Navy for aeronautical testing and research. The recommended period of significance for the historic property would have been 1942, when the first buildings were constructed on the property, to 1993, when the ATL/NAWCAD studies were relocated to other military facilities; however, due to the ongoing demolition of all the contributing resources on Lot 4.02, the resource no longer retains sufficient historic integrity of feeling, association, design, materials, and workmanship. The remaining buildings on Lots 3, 4.01, and 9.90, consist of several ancillary buildings and structures that were not key contributing elements to the larger historic district and therefore do not retain sufficient integrity to be recommended eligible. For these reasons, the ATL/NAWCAD-Trenton Complex is recommended not eligible for listing in the NRHP.

BASE SURVEY FORM

Historic Sites #:

Property Name: First Presbyterian Church and Cemetery of Ewing

Street Address: *Street #:* 100 (Low) 101 (High) *Apartment #:* (Low) (High)

Prefix: *Street Name:* Scotch *Suffix:* *Type:* RD

County(s): Mercer County **Zip Code:** 08628

Municipality(s): Township of Ewing **Block(s):** 365; 367

Local Place Name(s): **Lot(s):** 2; 6, 60

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

The First Presbyterian Church and Cemetery of Ewing occupies two irregularly shaped parcels which are bisected by Scotch Road in Ewing Township. On the west side of Scotch Road, there is an approximately 55-acre plot of land containing a circa-1867 Romanesque Revival church building and an active cemetery with burials spanning from 1722 to present day, and on the east side there is a 6.2-acre parcel composed of two lots containing a circa-1950 educational building presently known as Ewing Covenant Presbyterian Church, a 1912 Sunday School building, a circa-1950 Scout Hut, and an 1880 manse (Plates 1–23). While the extant sanctuary was constructed in 1867, this is the fourth building serving the local Presbyterian congregation constructed on the site, and the subject property has been in use as a Presbyterian place of worship and burial ground since 1709. The subject parcels are bounded by an apartment community and William C. Forst Lane to the north, the late eighteenth-century Ewing Cemetery and a labor union headquarters to the south, mid-twentieth-century municipal buildings to the east, and wooded land to the west. On the east side of Scotch Road, Block 367, Lot 6 is traversed by an asphalt-paved driveway which encircles the parcel's four buildings and a smaller, semi-circular driveway providing access to the educational building and manse. Block 367, Lot 60 is wooded.

Additional Information:
The First Presbyterian Church and Cemetery of Ewing was determined individually eligible for the New Jersey Register of Historic Places by the New Jersey Historic Preservation Office on September 9, 2008. This historic property is eligible under Criterion C as an example of a Romanesque Revival Church and under Criterion A for its representation of the area's settlement patterns, particularly by Scottish Presbyterians, and changing political boundaries throughout the mid-nineteenth century. The period of significance spans from 1709 to circa 1950, and the contributing resources include the 1867 church, the 1709 cemetery, the 1880 manse, the 1912 Sunday school building, and the 1954 school building (Saunders 2009).

Roof Finish Materials:	Slate		
Exterior Finish Materials	Stone, Random Ashlar		

Exterior Description:

The First Presbyterian Church of Ewing is a two-and-a-half-story, three-by-six-bay church built in 1867 in the Romanesque Revival style (see Plates 1–9). Built of uncoursed brownstone, the church takes on a basilical form. The building is topped by a front-gable, slate-shingled roof with a projecting, square central tower along the northeast elevation, which is topped by an octagonal, slate shingled spire. The main entrance is located in the tower on the primary (northeast) elevation and consists of wood double doors with glazed, arched panels, which are topped with a semicircular arched transom composed of paneled wood, which is presently filled with recently installed decoration. The main entrance is recessed into a vestibule of concentric, rounded arches of coursed stone, topped by a gabled pediment, and is accessed by four concrete steps flanked by metal railings. *See Continuation Sheet.*

Interior Description:

The subject property is a privately owned parcel. At the time that fieldwork was performed, access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building. The following description was made using photographs found on the 1867 Sanctuary's website. *See Continuation Sheet.*

Setting:

The church building sits at a curve in Scotch Road and is set back approximately 30 feet from the roadway with its primary elevation facing northeast, accessed by a concrete sidewalk. The building sits at the eastern edge of a burial ground, with the oldest grave markers (dating to the eighteenth century) concentrated around the building. A parking lot is located on the east side of Scotch Road opposite the subject building and is connected by a crosswalk across Scotch Road. The area around the church is flat and contains some mature trees. The surrounding area is characterized by other late nineteenth- to mid-twentieth-century buildings associated with the subject church, a late nineteenth-century cemetery, and primarily mid-twentieth-century mixed development, including residential, commercial, religious, and municipal uses.

Style: Other **Remaining Historic Fabric:** High

Acreage: 55.73

Hardscape: Driveways, Asphalt

Plantings: Mature Hardwoods; Shrubbery; Planted Beds

Other Features: Fences, Stone

Description:

The First Presbyterian Church Cemetery is situated on the west side of Scotch Road, approximately 720 feet south of its intersection with Upper Ferry Road (see Plates 9–16). The cemetery surrounds the First Presbyterian Church of Ewing on the north, south, and west sides, and is crossed by an orthogonal grid of asphalt-paved driveways which connect to Scotch Road at five points, each of which features a wrought iron gate. At the southern end of the cemetery, a circular driveway serves two small, single-story crematory buildings which were constructed circa 1980 and circa 2006. The cemetery is bounded along Scotch Road by a rusticated stone wall which is topped by rusticated stone coping. Several mature trees are interspersed throughout the cemetery, particularly in sections bordering Scotch Road and the sanctuary. While some sections of the cemetery do not appear to be laid out in a strict grid, particularly those closest to the church and in the cemetery's westernmost area, the majority of the burials are laid out in grid patterns which reflect different eras of cemetery development. The gravestones in the First Presbyterian Church Cemetery range from 1722 through the present, and the existing grave markers reflect different periods of history. The oldest gravestones are located closest to the church, and in general, the burials become more recent moving further from the church. *See Continuation Sheet.*

Setting:

The First Presbyterian Church Cemetery is located along the west side of Scotch Road in Ewing New Jersey and encompasses an 1867, Romanesque Revival Church on its north, south, and west sides. On the east side of Scotch Road, opposite the subject property, there are additional late nineteenth- and mid-twentieth-century buildings associated with First Presbyterian Church (now the Ewing Covenant Presbyterian Church) and a mid- to late nineteenth-century cemetery. The surrounding area is characterized by primarily mid-twentieth-century mixed development, including residential, commercial, religious, and civic uses.

Designer:	Unknown	**Physical Condition:**	Fair
Builder:	Unknown	**Remaining Historic Fabric:**	Medium
Style:	Other		
Form:	Gable front	**Stories:**	2
Type:	Other	**Bays:**	3
Roof Finish Materials:	Asphalt shingles		
Exterior Finish Materials	Aluminum siding		

Exterior Description:
The Sunday School Building at the First Presbyterian Church of Ewing is a vernacular, two-story, four-bay frame building with a one-story addition on the northwest elevation, which was constructed in 1912 as a space for the church's Sunday School and as the dwelling of the cemetery's superintendent (see Plates 17–18). This building is topped by an asphalt-shingled, front-gabled roof, which is pierced on the northwest and southeast elevations by gabled dormers. A brick chimney with corbelling extends from the rear (northeast) elevation. Sections of the eaves on the northwest and southeast elevations are slightly lifted to accommodate windows at the roofline. The exterior is clad in aluminum siding, which is red along the first story and white along the second story. The main entrance is located in an enclosed, partial-width porch which extends from the south bay of the primary elevation and is topped by a hipped, asphalt-shingled roof and accessed by five concrete steps with metal railings. The entryway consists of a half-glazed, wood replacement door with two inset panels and a half-glazed sidelight. *See Continuation Sheet.*

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The Sunday School Building sits along the southwestern edge of Block 367, Lot 6 in Ewing Township, Mercer County, New Jersey. This building is oriented southwest and is set back from Scotch Road approximately 75 feet. A semicircular asphalt driveway runs along the south side of the building and curves southward. Two concrete sidewalks connect this driveway to entrances to the subject building. A third concrete sidewalk extends northeast from Scotch Road to the building's primary elevation. A mature tree sits adjacent to the building's façade. The area immediately surrounding the building is grass lawn, with an asphalt-paved parking lot located approximately 60 feet to the northwest. Additionally, there is an asphalt-paved driveway along the building's northeast elevation which encircles all four buildings on the lot.

☒ **BUILDING** ☐ **STRUCTURE** ☐ **OBJECT**

Common Name:	Ewing Presbyterian Covenant Church		
Historic Name:	Education Building, The First Presbyterian Church of Ewing		
Present Use:	Religious Activities (nonresidential)		
Historic Use:	Religious Activities (nonresidential); Educational activity (schools)		
Construction Date:	Circa 1950	**Source:**	NETR 1947, 1953
Alteration Date(s):	1961, late twentieth century	**Source:**	Kull 2009, Stylistic evidence
Designer:	Unknown	**Physical Condition:**	Good
Builder:	Unknown	**Remaining Historic Fabric:**	High
Style:	Modernistic		
Form:	Irregular	**Stories:**	1
Type:	Other	**Bays:**	N/A
Roof Finish Materials:	Asphalt Shingles		
Exterior Finish Materials	Brick, running bond		

Exterior Description:
The former First Presbyterian Church Education Building (now Ewing Presbyterian Covenant Church) is a circa-1950, one-and-one-half-story building with a circa-1961 rear-ell and an additional, single-story addition projecting from the westernmost bay of the southeastern elevation (see Plates 19–20). This building is constructed of running bond brick and is topped by an asphalt-shingled, cross gabled roof, which is pierced at various points by metal utility structures. There is an exterior brick chimney located on the southeastern elevation of the addition as well as an exterior brick chimney on the northwest elevation of the main block. The main entrance sits along the primary elevation beneath an asphalt-shingled, front-gabled overhang with doric columns and vinyl in the gable end, and consists of half-glazed, nine light wood double doors with two inset wood panels. This paired entry is flanked by two identical half-glazed, nine-light, wood doors with two inset wood panels. There are additional entrances on the southeast and northeast elevations of the rear-ell. The windows throughout are one-over-one, double-hung vinyl replacement units, which are grouped into pairs on the main body of the building and grouped into triple windows on the rear-ell. These windows are placed symmetrically throughout. The building connects to the adjacent circa-1912 Sunday School Building through an enclosed walkway extending from the building's northwest corner. The building sits atop a concrete foundation.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The Ewing Covenant Presbyterian Church is located on Block 367, Lot 6 in Ewing Township, Mercer County, New Jersey. This building is oriented southwest and is set back from Scotch Road approximately 115 feet. A semicircular asphalt driveway runs along the southwest side of the building, providing access to the main entrance, and intersecting with Scotch Road at two points. This driveway is lined by a concrete sidewalk, which connects to the building's main entrance. An additional asphalt parking area sits at the northern corner of the building and connects to the parcel's outer driveway. A concrete sidewalk extends from this driveway to a rear entrance on the building's rear-ell. A children's play yard, which is enclosed by a chain-link fence, sits at the building's northeast corner. The Scout Hut sits approximately 30 feet north of the building.

BUILDING/ELEMENT ATTACHMENT

Historic Sites #:

☒ **BUILDING** ☐ **STRUCTURE** ☐ **OBJECT**

Common Name:	Manse, First Presbyterian Church of Ewing		
Historic Name:	Manse, First Presbyterian Church of Ewing		
Present Use:	Office activity – private business; Other		
Historic Use:	Residential activity-permanent (single family); Office activity – private business		
Construction Date:	1880	**Source:**	Kull 2009; Date stone
Alteration Date(s):	Circa 1958	**Source:**	
Designer:	Unknown	**Physical Condition:**	Fair
Builder:	Unknown	**Remaining Historic Fabric:**	High
Style:	Queen Anne		
Form:	Gable front	**Stories:**	2.5
Type:	Other	**Bays:**	5
Roof Finish Materials:	Slate		
Exterior Finish Materials	Brick, Flemish bond		

Exterior Description:

The Manse at the First Presbyterian Church of Ewing is a circa-1880, two-and-a-half-story, Queen Anne dwelling with an irregular footprint consisting of an L-shaped main block with various projecting blocks (see Plates 21–22). This building is topped by a slate-shingled, cross-gabled roof with gabled blocks projecting from the southeast and northeast elevations. There is an interior brick chimney and an exterior concrete chimney extending from the roof slope along the northwest elevation. The exterior is clad in brick, with some sections of scalloped wood shingles located in the gable ends and on some of the projecting blocks. The primary (southwest) elevation is recessed on the south side and features a wraparound porch with wood railings and turned wood posts which support a slate-shingled overhang. The porch is accessed by four wood steps and shelters four entry doors. The main entrance is located at the center of the primary elevation and consists of a replacement door and vinyl storm door. *See Continuation Sheet*

Interior Description:

The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:

The Manse of the First Presbyterian Church of Ewing is located on Block 367, Lot 6 in Ewing Township, Mercer County, New Jersey. This building is oriented southwest and is set back from Scotch Road approximately 118 feet. The building is accessed by the property's inner driveway, which runs along the primary elevation, and the outer driveway, which connects to the building's rear elevation. A concrete sidewalk runs between these two driveways on the northwest side of the Manse. Three concrete sidewalks around the building's south corner connect the two driveways to the building's wraparound porch. The Manse is located approximately 50 feet south of the Ewing Covenant Presbyterian Church.

Common Name: Scout Hut
Historic Name: Scout Hut
Present Use: Other
Historic Use: Other
Construction Date: Circa-1950 **Source:** NETR 1947, 1953
Alteration Date(s): N/A **Source:** N/A
Designer: Unknown **Physical Condition:** Fair
Builder: Unknown **Remaining Historic Fabric:** High
Style: Other
Form: Other **Stories:** 1
Type: Other **Bays:** 5
Roof Finish Materials: Asphalt shingle
Exterior Finish Materials Concrete block, modern

Exterior Description:
The Scout Hut is a circa-1950, one-story, five-bay-wide rectangular building which is oriented southeast (see Plate 23). The building is topped by a side-gabled, asphalt-shingled roof with overhanging eaves on the northwest and southeast elevations. A large, exterior chimney is located along the northwest elevation and is composed of rubble stone at the base and brick on the chimney's upper half. The building is made of concrete masonry units with vertical wood plank siding filling the gable ends. The main entrance is located along the southeast elevation and was not visible from the public right-of-way. A secondary entrance is in the central bay of the northwest elevation and consists of a metal door which is accessed by a single concrete step. The fenestration on the rear elevation is symmetrical, and there is no fenestration on the southwest elevation. Windows throughout consist of original, metal two-over-two or three-over-three windows with double-hung operation. These windows each have painted brick sills.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The Scout Hut is located on Block 367, Lot 6 in Ewing Township, Mercer County, New Jersey. This building is oriented southeast and is located approximately 30 feet north of the Ewing Covenant Presbyterian Church. The asphalt driveway which runs along the outside of the various buildings runs directly adjacent to the Scout Hut's northeast elevation. The building's primary elevation is oriented southeast onto a small, asphalt-paved parking area which is bordered by the Scout Hut and the Ewing Covenant Presbyterian Church. A mature tree stands at the building's western corner, and the northwest elevation borders grass lawn.

CONTINUATION SHEET

Historic Sites #:

Exterior Description, continued from Building/Element Attachment: The First Presbyterian Church of Ewing:

On the rear (southwest) elevation, there are two identical entrances consisting of arched, wood doors with two inset panels situated beneath an arched, stained-glass light, each of which is topped by coursed stone lintels. These doors are placed symmetrically on each side of a one-story, rectangular apse projecting westward from the main body of the church and are accessed by sets of three concrete steps with metal railings. There is a non-historic, half-glazed metal door located in the easternmost window bay on the south elevation, which is accessed by a concrete ramp with a metal railing. The church contains a variety of round-arched, stained-glass windows. On the primary façade, there are three paired, stained-glass window units which are sheltered on the exterior by decorative wood-framed, glazed windows. The north and south elevations of the church feature six round-arched stained-glass windows in metal framing, which are separated into bays by flat buttresses. There is an additional circular stained-glass window lighting the apse. There are rose windows located on each elevation of the central tower and louvered trefoil dormers at the base of the spire. The corners of the main body of the church as well as the corners of the tower are fortified by octagonal, coursed ashlar buttresses, each of which is topped by stone pinnacles. There are four additional pinnacles located behind each of the four buttress pinnacles. There is a datestone reading "1867" positioned below the rose window on the primary elevation of the tower. The building's façade features various decorative elements including stone banding and a combination of coursed and uncoursed stone. The building sits atop a stone foundation.

Interior Description, continued from Building/Element Attachment: The First Presbyterian Church of Ewing:

The First Presbyterian Church of Ewing follows a basilica plan. The main entrance leads into a narthex on the east side of the building, which is fully enclosed. The narthex accesses the church's nave by two wood-paneled doors with arched panels, which are located at the north and south ends of the wall. The nave contains 14 rows of dark wood pews, which are separated by a central aisle. These pews are oriented west towards a chancel. The chancel is elevated by two steps and enclosed by a carved wood railing. Stepped up an additional three steps within the chancel is the altar, which is located in a rounded apse lined by decorative molding and is centered under a rose window. There are exit doors, marked by signs, flanking the chancel. A balcony at the eastern end of the nave is likely accessed from a staircase connecting to the narthex. The balcony contains recessed alcoves at the northeast and southeast corners and a curved wall and railing along its eastern edge. The church features a vaulted wood ceiling with exposed wood beams. There is thick wood molding along the top of the interior walls. The floors throughout are dark wood, with a section of carpeted floors in the chancel. Wood plank wainscotting runs along the walls throughout. Based on imagery, the interior walls of the church appear to be sheathed with drywall. Stained-glass windows are recessed into both the north and south walls of the nave, the chancel and apse, and the narthex and balcony. Metal light fixtures are hung regularly throughout the nave, along with more recently installed lights.

Description, continued from Building/Element Attachment: The First Presbyterian Church Cemetery of Ewing:

The earliest gravestones, dating to the eighteenth and early nineteenth centuries, are mostly simple fieldstone or sandstone tablet graves with minimal inscription. These graves are found immediately adjacent to the church, particularly on its west and south sides, and are not arranged in a strict grid pattern. Moving westward and northward, the cemetery is primarily populated by burials from the mid-nineteenth to early twentieth century. Most nineteenth-century markers are upright stones which are made predominantly of granite and sandstone. Obelisks, pedestal tombs, mausoleums, and stylized grave markers indicate the Romantic nature of these graves. The furthest burial sections contain grave markers from the mid-twentieth century to the present day. These markers are mass-produced stones made of granite which often feature designs of crosses and horizontal massing. Also present from the twenty-first century are flat, flush with the ground markers, as well as slanted markers. A circa-2005 maintenance building and asphalt-paved access roadway are located at the northwestern corner of the property.

Exterior Description, continued from Building/Element Attachment: Sunday School Building:
There is an additional entrance in the northernmost bay of the primary elevation which consists of a vinyl, glazed storm door and three-light wood door which may have been installed in the mid-twentieth century, which is also accessed by five concrete steps with metal railings. A third entrance is located on the southeastern elevation and consists of a half-

Exterior Description, continued from Building/Element Attachment: Sunday School Building, continued:
glazed, nine-light replacement door and vinyl storm door, which are accessed by five concrete steps with metal railings and are sheltered beneath an asphalt-shingled, gabled overhang with vinyl in the gable end. The windows throughout are predominantly one-over-one, double-hung vinyl replacement units, which are often paired. The paired windows in the second story on the primary elevation and the windows in the dormers on the side elevations are topped by pointed-arch glazed transoms. The windows on the first story of the southeast and northwest elevations are four-over-two, double hung units. There is a six-light window unit on the one-story projection along the northwest elevation. The rear elevation connects to the adjacent educational building at the northernmost bay of the rear (northeast) elevation through an enclosed walkway. The building sits atop a stone foundation which is pierced by vinyl basement windows at various places. The added sections of the building (the entry porch and the side projection) sit atop poured concrete foundations.

Exterior Description, continued from Building/Element Attachment: The Manse:
Two doors are located in the two southernmost bays of the primary elevation. One of these entrances consists of a wood door with a rectangular transom light, while the other was not clearly visible from the public right-of-way. The fourth entryway is accessed from the porch on the southeast elevation and consists of a wood door with a rectangular transom light. There is a small balcony with decorative woodwork on the second floor in vertical alignment with the main entrance, which is accessed by a half-glazed wood door and vinyl storm door. Additionally, there is a rear entrance on the northeast elevation. The windows consist mostly of double-hung units with sixteen-over-two or sixteen-over-sixteen configuration of varying sizes. These windows are at times paired. In the sections of the building which are clad in brick, these windows feature masonry sills and brick lintels. There is a rectangular, 60-light fixed window on the second story of the primary elevation. The building sits atop a masonry foundation. The rear elevation was inaccessible from the public right-of-way.

History:
The First Presbyterian Church and Cemetery located along Scotch Road is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. The area that would later be known as Ewing Township was settled in the early eighteenth century by families whose members had immigrated from England and Scotland, and more recently settled nearby regions such as Long Island. Some of the earliest settlers in the area were members of the Green, Hutchinson, Howell, Reed, Lanning, Clark, Reeder, and Burroughs families. At the time, Ewing Township was a part of Hopewell Township. Present-day Mercer County was largely settled by Irish and Scotch Presbyterians and Quakers, each of whom established houses of worship and schools throughout the region (Woodward and Hageman 1883:546). In 1709, approximately 2 acres of land at the location of the subject church was conveyed from Alexander Lockhart to 17 of the area's early settlers. By 1712, the first house of worship, known as the Hopewell Church, was constructed on the site: a log cabin which would hold services for a local Presbyterian congregation. Mr. Robert Orr presided as the pastor of the church for its first four years (Hall 1858:40). In 1735, Mr. David Cowell was ordained and installed as pastor. He held this role until his death in 1760 (Smith 1876:5). This church was among the earliest wave of Presbyterian churches constructed in the area and played a vital role as a space for worship and community in the developing township.

The adjacent burial ground was established around the same time as the construction of the first church on the site. The tradition of burials in a churchyard was common throughout much of Colonial America, including the mid-Atlantic region, and emulated the dominant traditions in England at the time. Eighteenth-century churchyards in America were often populated by rows of simple headstones, which by the end of the century were regularly inscribed with some basic information about the deceased (Cothran and Danylchak 2018:54). The earliest legible burial marker belongs to Judge William Green, who died in 1722 at age 50. Green was an English immigrant who had previously lived in Philadelphia

CONTINUATION SHEET

Historic Sites #:

History, continued:
and Long Island before settling in Ewing around 1700 with his wife Joanna Reeder. Green was among the first judges of Hunterdon County (Find a Grave 2024a). It is possible that the subject cemetery contains earlier burials from 1709–1722 whose grave markers are illegible or were not inscribed.

The log structure which housed the church was replaced in 1726 by a frame building. Within the same year, a second church building was constructed in Trenton. This church building and the frame church on the subject property in Ewing served a single congregation. The Trenton church was constructed to provide easier access for the burgeoning population that had increased significantly in that area (Hall 1858:57). The church building on the subject property became known as the "country" or "old" church, while the building in Trenton became the "town" church (Presbyterian Historical Society 2024). Due to shifting municipal boundaries, the church was again renamed in 1788 as The First Presbyterian Church of the Town of Trenton. By the end of the following century, Trenton would house six Presbyterian churches, each of which "may be regarded as the outgrowth of the venerable First Presbyterian Church of which the Rev. John Hall D.D. is still the pastor" (Woodward and Hageman 1883:547).

The church building on Scotch Road in Ewing Township was replaced again by a brick structure around 1795. According to an 1867 sermon, this church was largely constructed by members of the congregation, along with some professional contractors. This brick structure, the third building built on the subject property, was remodeled in 1839. The church's doors were moved from the south elevation to the east elevation, and the pulpit was moved to a newly added recess on the west side of the building (Atwater 1867:15–16). This building was a front-gabled, brick building with symmetrical, multi-light windows and two pedimented entrances on the primary elevation. Based on historical imagery of this building, it appears that the churchyard was encircled by a rustic, low stone wall with smooth coping (1867 Sanctuary 2024). In 1834, the township of Ewing was incorporated, and ten years later the church was reincorporated as The First Presbyterian Church of Ewing (1867 Sanctuary 2024).

By the end of the eighteenth century, several individuals from Ewing's earliest settler families were buried in the graveyard, including the Scudders, Howells, and the Reeds (Find a Grave 2024b). In addition to Ewing's earliest settlers, this cemetery held the burials of over 30 Revolutionary War soldiers (Kull 2009; Historical marker). These early burials were concentrated closest to the church building and were characterized by fieldstone grave markers and simple tablet headstones made of sandstone and slate. Prior to 1850, sandstone was the most commonly used material for grave markers, as it was found frequently in New Jersey and the soft stone was easy to inscribe (Sarapin 1994:20).

The brick church was replaced by the extant stone building in 1867. According to the final sermon preached in the previous church building by pastor David J. Atwater, the new church building was constructed "to furnish increased accommodations for the worship of God. We wish to enlarge our dimensions, to lengthen our cords, so that we can invite those who from time to time may settle among us, to unite with us in the worship of God" (Atwater 1867:26). According to the building's specifications, the new building could incorporate material from the earlier building, as long as the material is "of suitable size and quality" (Sidney 1867:1). The proposed new building was specified to be built of light-colored brownstone from J. P. Greene's Quarry in Greensburg with walls that were 22 feet high and 18 inches thick and topped by a tarred roof, which would be laid over with Blue Mountain (or equivalent) slate (Sidney 1867:1, 7).

The construction of this building was authorized in February 1867, and the building was dedicated approximately nine months later on November 20 (Smith 1876:13–14; Figures 1–2). The church was built in the Romanesque Revival Style and featured a coursed brownstone exterior, tall round-arched stained-glass windows, octagonal buttresses with pinnacles, and a central, square tower topped by an octagonal spire (1867 Sanctuary 2024). This style gained popularity in America in the mid-nineteenth century for religious architecture as a more economical and easier-to-build alterative to the Gothic style. In particularly, the style was popularized among Presbyterian congregations as they perceived the Romanesque Revival style to be less allied to the Catholic church (Gelernter 1999:152). This church building was likely

CONTINUATION SHEET

Historic Sites #:

History, continued:

larger than its earlier iterations, particularly the eighteenth-century log and frame buildings, and necessitated the movement of some early graves. William Green's grave, once the closest burial to the church building, was moved at this time to accommodate the new construction (Find a Grave 2024a).

The stone church was designed by Philadelphia architect, engineer, cartographer, and landscape architect James C. Sidney and constructed by Philadelphia builder Smith E. Hughes. Prior to the construction of the subject church in 1867, Sidney had already completed a number of significant projects in his various areas of expertise, including the creation of numerous maps of the city of Philadelphia, the design of an expansion to Laurel Hill Cemetery in Philadelphia, and the contribution of six plates to Thomas Ustick Walter and John Jay Smith's *Two Hundred Designs for Cottages and Villas*. Around 1850, Sidney published *American Cottage and Villa Architecture*, a series of drawings of structures found throughout the United States (Philadelphia Architects and Buildings 2024). From the 1840s to the mid-1860s, Sidney worked with various partners in Philadelphia and New York to produce architectural and engineering work. By the time the subject church was designed, however, Sidney was working independently. Sidney's work includes residences, public schools, and banks, which were largely designed in the popular Gothic Revival and Romanesque Revival styles. A decade prior to the First Presbyterian Church of Ewing, Sidney's firm had designed an Episcopal Church in Philadelphia which shared the subject church's general massing, stone exterior, rounded-arch windows, and small rose window (Philadelphia Architects and Buildings 2024).

In 1880, the First Presbyterian Church of Ewing Manse was construction on the opposite side of Scotch Road from the church. The construction of this Queen Anne dwelling was funded by financier Harvey Fisk, who was married to church member Louisa Green. This manse was first inhabited by Reverand Samuel Lowrie, who was the pastor from 1879 to 1885, along with his family of eight and four servants (Kull 2009:6).

As the nineteenth century progressed, the cemetery expanded westward, and the character of its grave markers also evolved. Cemetery planning in the latter half of the nineteenth century was guided in large part by the Rural Cemetery Movement, which stemmed from both changing conceptions of death and remembrance that drew upon Romantic ideologies as well as increasingly overcrowded and unsanitary cemetery conditions in American cities. Rural cemeteries of this period generally included meandering footpaths revealing picturesque views, organization into family burial plots, and a landscape which drew upon English gardening traditions (Cothran and Danylchak 2018:26–32). While the subject cemetery was still in use and presumably expanding during this period, the existing grid of rectilinear pathways which guide circulation through the cemetery and the relatively infrequent presence of delineated family burial plots indicate that the principles of the Rural Cemetery Movement were not heavily applied. It is possible that the mature trees which line some of the pathways and are located throughout sections of the cemetery in proximity to the church—particularly sections which are populated with late nineteenth- to early twentieth-century graves—were added to the cemetery's design and/or planted during this period of time. Grave markers found in the cemetery more significantly reflect the transition to Romantic principles of cemetery planning and burial traditions. Markers from the mid-nineteenth to early twentieth century are generally more elaborate monuments, consisting of obelisks, cradle graves, mausoleums, and more elaborately carved headstones, which were often made of granite or sandstone. Grave markers found during this period were often more sculptural and incorporated symbology into the monuments. For example, the white bronze monument of Mr. Fish dating to 1882 was designed and fabricated by the Monumental Bronze Company in Bridgeport, Connecticut. This company was the only producer of white bronze monuments in the country and operated in the period between the Civil War and World War I. The Fish monument is an elaborate obelisk, containing various sculptural details (Ivanoff n.d.). The Fish family also added an hourglass image to the front of the monument, which was believed to symbolize the passage of time towards death, or the cyclical nature of life.

The earliest known alterations to the extant church building were in the 1880s, about 15 years after its initial construction. At this time, heat was added to the building as a gift from Mrs. Henry Fisk (1867 Sanctuary 2024). At the beginning of 1896, the church's steeple and a significant amount of stone from the tower were destroyed in a violent

CONTINUATION SHEET

Historic Sites #:

History, continued:
windstorm (Courier News, 2 January 1896:7). The tower and steeple were subsequently replaced with a shorter steeple (Courier News, 2 January 1896:7; 1867 Sanctuary 2024).

The church remained in active use throughout the early twentieth century, and renovations to the church building reflect the ongoing needs of its congregation. In 1912, a front-gabled building was constructed on the east side of Scotch Road to house the cemetery superintendent's dwelling on the first floor and provide space for Sunday School on the second floor (Kull 2009). In the 1940s, the church's dirt basement floor was dug out by members of the youth choir for choir rooms. A few years later, in 1951, the organ was moved from its location at the front of the nave to the north of the altar to the rear balcony and the chancel was divided in two to accommodate a pulpit and a lectern. Later that decade, the rose and apse stained glass windows were installed (1867 Sanctuary 2024; Kull 2009).

As the church evolved in the 1940s and 1950s, so did the cemetery. Around 1947, the cemetery was expanded southward (NETR 1940, 1947). The system of rectilinear pathways was extended, and a large circular section of pathway was added (Figures 3–4). A decade later, the cemetery had also been expanded westward, and the newly added sections were gradually populated with burials. After World War II, gravestones became smaller, spouse plots largely replaced family groupings, and there was a greater uniformity of headstone design. The late nineteenth century saw the introduction of mass-produced flush and slant gravestones with etched symbols of personal interests (McGuire 1988:446–456). At subject cemetery, many of the grave markers reflect this overarching shift in burial planning and design. The sections of the cemetery containing burials from the mid-twentieth century to the present feel more open and less varied than areas closer to the church. Grave markers often consist of either a flat headstone, slanted gravestone, or an upright tablet and base configuration with generally horizontal massing. Common gravestone materials are granite and marble.

Between 1947 and 1953, the existing stables which were located behind the Sunday School Building were demolished. In their place, an education building (currently known as the Ewing Covenant Presbyterian Church) and Scout Hut were constructed around a parking area, which was connected to Scotch Road by a driveway (NETR 1947, 1953). Throughout the 1950s, leaders in the church discussed the construction of new buildings and alteration or demolition of existing buildings to accommodate their growing program of religious education and a need for expanded office space to support the overall operations. In the mid-1950s, the Church Planning Committee discussed the construction of a new manse, as the existing structure was threatened by its deteriorated condition and potential plans to expand Scotch Road, the construction of additional parking, the improvement of existing spaces to ensure well-lit and well-ventilated rooms, and the construction of a new educational-administration unit (McCarroll 1956). The committee ultimately decided, however, not to abandon the existing manse in favor of a new building. Internal repairs were made to the building to convert it for use as offices and school overflow, and, in 1958, the manse was converted to these uses. In 1961, a rear wing was added to the educational building (Kull 2009). In the mid-twentieth century, the First Presbyterian Church of Ewing buildings were frequently used for office and recreation space by the local YMCA chapter, as well as the Abiding Presence Lutheran Church as it was being formed (Drake 1976).

In 1967, the congregation celebrated the centennial of the church building. At this time, new stained-glass windows were added to the nave and narthex. These new windows were created by the Willet Glass Company in Philadelphia and depict the history of the Christian Church from the calling of the disciples to the founding of the First Presbyterian Church's congregation in the early eighteenth century (1867 Sanctuary 2024). In the final two decades of the twentieth century, air conditioning was added to the sanctuary, a handicap ramp was added, some pews were removed to aid wheelchair access, and a first-floor restroom was added. Additionally, the solid red front doors were replaced by glass-paneled doors, and new stained-glass windows were installed in the nave doors (1867 Sanctuary 2024).

In 2007, the First Presbyterian Church of Ewing was closed due to structural concerns, and the congregation moved to the educational building situated across the street from the subject property. In the following years, a community fundraising campaign was started with goals to restore the church; however, the fundraising goals were not met, and, in

CONTINUATION SHEET

Historic Sites #:

History, continued:
2009, the church's governing body voted to demolish the building. The decision to demolish was divisive among the congregation, and as a result an independent commission was arranged to settle the issue. After an 11-month period, the commission decided not to demolish the building. In the spring of 2012, Preservation NJ signed a 50-year lease on the building and assumed responsibility for its restoration and reuse (Karas 2012). Throughout 2012, the building underwent various repairs which would allow for occupancy once again, such as the addition of smoke detectors and a security system (Brill 2012). During this time, repair work was done to the weathered exterior stone and some of the stained-glass windows. In 2023, Preservation NJ ended its lease of the building and transferred the site back to the Presbytery of the Coastlands. The church is currently known as The 1867 Sanctuary and is being used for community gatherings, weddings, funerals, and other events (Hastings 2023).

Significance:
The First Presbyterian Church and Cemetery of Ewing is a locally significant example of a Presbyterian church and associated burial ground in Ewing Township, Mercer County, New Jersey which has been in continuous use from its establishment in the early eighteenth century to the present day. Initially established in 1709 by a group of Ewing's early settlers, the local Presbyterian congregation has used this site as a place of worship, community, and burial for over 300 years. The extant church building is the fourth iteration of a Presbyterian house of worship to be located at this site and was constructed in 1867 by architect James C. Sidney. While this building does not date to the initial settlement of the property, it embodies the site's continuity of use as a Presbyterian church. This building is a distinctive example of the Romanesque Revival style containing features such as its brownstone construction, rounded arched doors and windows, central tower with an octagonal spire, and octagonal buttresses with pinnacles. While the church has undergone several alterations since its construction, including the replacement of its spire and stained-glass windows, addition of an access ramp, and various interior modifications, these alterations are compatible with the church's initial design, and the building retains a high degree of architectural integrity. The cemetery which surrounds the church contains burials dating to the early eighteenth century. The cemetery reflects evolving views on burial practices, cemetery planning, and grave marker design, and exists as an intact collection of grave markers reflecting distinct periods of grave marker design and local Presbyterian burial practices. These grave markers range from the fieldstones and simple tablets of the eighteenth century, which are concentrated close to the church building, to the more elaborate, sculptural grave markers, family plots, and mausoleums of the mid- to late nineteenth century, to the frequently mass-produced slanted or upright tablet-and-base stones of the post-war period. The cemetery contains the burials of several of Ewing's earliest settlers as well as over thirty Revolutionary War soldiers. On the opposite side of Scotch Road, numerous buildings were constructed from the late nineteenth to the mid-twentieth century to accommodate changes in church operations. These buildings include an 1880 Manse, a 1912 Sunday School Building, a circa-1950 Scout Hut, and a circa-1950 educational building with a 1961 addition. While all buildings on the subject property have undergone alterations such as the replacement of cladding materials, windows and doors, and the construction of additions, these buildings retain a sufficient amount of architectural integrity.

Justification of Eligibility/Ineligibility:
The First Presbyterian Church and Cemetery of Ewing is recommended eligible for listing under Criteria A and C of National Register of Historic Places (NRHP) in the areas of Religion and Architecture. The property has a period of significance from 1709, when the property was initially developed as a Presbyterian church and burial ground, to circa 1960, when many of the associated church buildings underwent alterations to their architecture and use. Contributing structures and landscapes to the historic property include the 1867 First Presbyterian Church of Ewing, the 1709 First Presbyterian Church of Ewing Cemetery, the 1880 Manse, the 1912 Sunday School Building, the circa-1950 Scout Hut, and the circa-1950 Education Building (now Ewing Presbyterian Covenant Church). Under Criterion A, the First Presbyterian Church and Cemetery of Ewing is a locally significant example of Ewing's settlement by English and Scottish Presbyterians and a focal point for the local Presbyterian community, as exemplified by the site's ongoing use for worship, religious education, and burials. Under Criterion C, the First Presbyterian Church of Ewing embodies the distinctive characteristics of the mid-nineteenth-century Romanesque Revival style and stands out as a locally significant

CONTINUATION SHEET

Historic Sites #:

Justification of Eligibility/Ineligibility, continued:
work of architecture. While the church has undergone various alterations, these alterations are compatible with its initial design and do not detract significantly from the building's overall integrity of design, materials, or workmanship. While the 1867 church building was constructed by popular Philadelphia architect James C. Sidney, this building is not a particularly notable example of his work. This property was not found to be eligible for the NRHP under Criterion B, and was not evaluated for eligibility on the NRHP under Criterion D.

Property Name: 110 Summit Avenue

Street Address: *Street #:* 110 *(Low)* _____ *(High)* *Apartment #:* _____ *(Low)* _____ *(High)*

Prefix: _____ *Street Name:* Summit *Suffix:* _____ *Type:* AVE

County(s): Mercer **Zip Code:** 08628

Municipality(s): Ewing Township **Block(s):** 379

Local Place Name(s): West Trenton **Lot(s):** 380

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

110 Summit Avenue is a 0.367-acre, rectangular parcel on the north side of Summit Avenue. This property consists of a two-and-one-half-story-tall, two-bays-wide, frame dwelling with projecting bays built circa 1900 and a one-story, rear shed constructed between 1920 and 1940 (Plates 1–4). The dwelling is set back from Summit Avenue by approximately 64 feet, while the shed is situated approximately 17 feet north of the dwelling. An approximately 34-foot-long, asphalt driveway extends northwest from Summit Avenue along the western parcel boundary. The property consists of a flat, grassy lawn, with mature trees scattered throughout the rear yard. The surrounding context consists of early and mid-twentieth-century dwellings. *See Building/Element Attachments*

Construction Date: Circa 1900 **Source:** Scarlett and Scarlett 1890; Stylistic Evidence
Alteration Date(s): Late twentieth Century **Source:** Stylistic Evidence
Designer: Unknown **Physical Condition:** Good
Builder: Unknown **Remaining Historic Fabric:** Low
Style: Queen Anne
Form: Four Square **Stories:** 2.5
Type: N/A **Bays:** 2
Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Vinyl Siding

Exterior Description, continued from Base Survey Form:
The dwelling is capped with an asphalt-shingled, hipped roof whose massing is complicated by projecting gables and gabled dormers on the southeast, southwest, and northeast elevations. An interior brick chimney extends from the rear (northwest) roof slope near the center of the dwelling. The exterior of the dwelling is clad in vinyl siding, while all of the windows contain double-hung, one-over-one replacement vinyl sash set in vinyl surrounds. The primary entrance sits slightly off-center on the primary elevation and features a half-glazed wood replacement door and vinyl storm door, which are set in vinyl surrounds. Flanking the entrance are individual double-hung windows. A one-story porch covers the door and window in the east half of the primary elevation. The porch consists of poured concrete steps that rise to an elevated poured concrete deck into which are anchored metal posts that support the asphalt-shingled, front-gabled roof with vinyl siding in the gable end. A metal railing encircles the porch. A three-sided, canted bay with double-hung windows in the angled sides projects from the second story above the porch. This section of the elevation rises above the eave line to a gabled roof that projects from the main hipped roof. One double-hung window pierces the center of this gable. A gabled dormer with a cornice return containing a one-over-one, double-hung vinyl window is located in the roof slope on the west bay of the primary elevation. An individual double-hung window is located in the south half of the primary elevation's second story. Above this side of the elevation, a small, gabled dormer with an individual double-hung window is located on the main slope of the roof. *See Continuation Sheet*

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject dwelling is sited approximately 64 feet north of Summit Avenue on the 0.367-acre, rectangular parcel. The primary elevation faces southeast. The building is connected to Summit Avenue by a masonry-paved pathway which extends southeastward from the front entrance and steps down to street level by two concrete steps at the southeastern edge of the lot. A perpendicular pathway which is also surfaced with masonry pavers branches off from this main pathway and connects to the asphalt-paved driveway which is located at the property's southern corner. The dwelling is bordered by landscaping and is surrounded by grass lawn with some mature trees.

Form: Other **Stories:** 1
Type: Shed **Bays:** 2
Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Wood siding

Exterior Description:
The shed at 110 Summit Avenue is a one-story, rectangular, frame structure which was likely constructed between 1920 and 1940. The garage is capped with a side-gable roof in asphalt shingles, which features exposed rafter ends on the primary (southwest) and rear (northeast) elevations. The exterior is clad in wood siding. The primary elevation contains a five-panel door which is situated in the northernmost bay. The windows throughout consist of one-over-one or two-over-two, double-hung vinyl replacement units. The shed was not visible from the public right-of-way and could only be seen through Google Streetview and real estate photos dating to 2017 (Google Streetview 2021; Redfin 2017).

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject shed is sited approximately 17 feet north of the dwelling on the eastern side of the 0.367-acre, rectangular parcel. The primary elevation faces southwest. The shed is bordered by landscaping consisting of some small shrubs and is surrounded by grass lawn with some mature trees. A low hedgerow separating the parcel from the adjacent lot runs along the east side of the shed.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
110 Summit Avenue is an example of a circa-1900, vernacular dwelling built in the neighborhood of West Trenton in Ewing, Mercer County. West Trenton, formerly known as Trenton Junction, developed over the course of the late nineteenth and early twentieth centuries as one of Ewing's earliest subdivisions. Its growth was largely attributed to the expansion of local rail transit which connected the Trenton Junction neighborhood of Ewing to the city of Trenton. The subject property was one of numerous vernacular dwellings which were constructed in the area around the turn of the twentieth century.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
110 Summit Avenue is recommended not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with any significant persons or events to qualify under NRHP Criteria A or B. The property is an unremarkable example of a circa-1900 dwelling commonly found in the area and does not possess sufficient significance to warrant NRHP-eligibility under Criterion C. In addition, alterations have been made, including the replacement of doors, windows, and siding, diminishing the integrity of the property. For these reasons, 110 Summit Avenue is recommended not eligible for listing in the NRHP under Criteria A, B, or C. The building was not evaluated under NRHP Criterion D.

CONTINUATION SHEET

Historic Sites #:

Exterior Description, continued from Building/Element Attachment: Dwelling, 110 Summit Avenue:
The fenestration on the northeast elevation is symmetrical. At the center of the northeast elevation is a slightly projecting bay that rises above the eave line of the main roof to a gabled projection. A gabled dormer projects from the roof slope along this elevation. The southwest elevation has slightly asymmetrical fenestration and another projecting bay capped by a gabled roof that extends from the main roof. The dwelling sits atop a masonry foundation which is parged above ground. The rear (northwest) elevation was not accessible via public right-of-way.

History:
The dwelling at 110 Summit Avenue is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (Trenton Evening Times, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; NETR 1931, 1947, 1963, 1970).

Summit Avenue is located within the West Trenton neighborhood of Ewing, previously known as Trenton Junction for its association with the construction of a nearby train station in 1881 (Falzini 2017:Chapter 2). By 1890, Summit Avenue and the adjacent streets had been laid out in a small grid and the lots subdivided. Development within the subdivided area, however, was relatively sparse and concentrated along Bear Tavern Road and Grand Avenue. At this time, the subject dwelling and shed were not yet constructed (Scarlett & Scarlett 1890). The subject dwelling was constructed around the turn of the twentieth century on the north side of Summit Avenue. Various stylistic details support this period of construction, including the Queen Anne massing and the original carved wood banister and newel posts in the house's interior (Redfin.com 2017). At this time, the dwelling was surrounded by undeveloped land. The area surrounding the subject parcel developed over the first half of the twentieth century with single-family homes. This development was encouraged largely by the increase of transit options which connected the suburb of Ewing to the adjacent city of Trenton, including more direct train service to Trenton Junction and the introduction of trolleys (Falzini 2017:Chapter 3).

By 1930, several houses were constructed along Summit Avenue. The majority of Summit Avenue residents at the time had moved there from elsewhere in New Jersey or nearby Pennsylvania. Some houses were inhabited by British or German immigrants. The people who lived on Summit Avenue in 1930 worked in a variety of jobs, including as architects, laborers, factory workers, and salesmen (United States Census Bureau [US Census] 1930). The rear shed which sits behind the main dwelling was constructed some time prior to 1940 (NETR 1940). In 1950, the dwelling at 110 Summit Avenue was inhabited by the Caulton family. Germaine and his wife Janet had moved to the subject dwelling from Lambertville at some point in the 1940s along with their son Keith and daughters Gayle and Carol. Germaine worked as a tool and diemaker for a machine shop, while Janet performed the household's domestic work (US Census 1950). It is probable that Germaine Caulton lived in the house until his death in 1981, and his wife Janet continued to live in the house until her death in 2009 (Trenton Historical Society 2024; Wilson Apple Funeral Home 2009). In July 2012, the subject property was sold out of the Caulton family, and the property was sold two more times in the 2010s. The current owners purchased the property in 2017. Between 2011 and 2018, a large tree was removed from the house's northwest corner, and a paved walkway was added to connect the existing walkway between Summit Avenue and the front door to the driveway at the property's western edge (Google, Inc. 2011, 2018).

CONTINUATION SHEET

Historic Sites #:

History, continued:
Based on stylistic evidence, the house has undergone numerous renovations within the late twentieth century. These alterations include the replacement of windows and doors throughout, as well as the recladding of the exterior in vinyl siding. The general form and massing of the house, however, have remained generally unaltered.

Municipality(s): Ewing Township **Block(s):** 379

Local Place Name(s): West Trenton **Lot(s):** 368

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

106 Summit Avenue is a circa-1945, one-and-one-half-story-tall, three-bay-wide, frame Cape Cod dwelling (Plates 1–3). The dwelling is capped with a side-gabled roof sheathed in asphalt shingles. Two gabled dormers with grouped double-hung windows pierce the southwest slope of the roof, with an overhanging eave over the center and northeast bay of the primary (southeast) elevation. A brick chimney extends from the northwest roof slope at the center of the building. The exterior of the dwelling is clad in vinyl siding, with a section of stone veneer in the slightly projecting, northeasternmost bay of the primary elevation. The primary entryway is located at the center of the southeast elevation and consists of a four-paneled wood replacement door with a patterned light, which is set in vinyl surrounds and is accessed by three concrete steps. There is a secondary entrance in the southwestern bay the rear (northwest) elevation, which also likely consists of a replacement door. The windows throughout are one-over-one double-hung vinyl units and are arranged in symmetrical fenestration patterns. On the northeast and southwest elevations, the windows are arranged in identical fenestration patterns with two windows on the first floor and a paired window unit in the gable end. On the primary elevation, the windows are flanked by inoperable vinyl shutters. The dwelling sits on a concrete foundation. The rear (northwest) elevation was not accessible via public right-of-way. *See Building/Element Attachments*

CONTINUATION SHEET

Historic Sites #:

History:

The dwelling at 106 Summit Avenue is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (Trenton Evening Times, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (NETR 1931, 1947, 1963, 1970; Ewing Township Planning Board 2006; Mueller 1918).

Prior to the construction of the subject dwelling, the subject property did not contain any buildings (NETR 1940). Summit Avenue is located within the West Trenton neighborhood of Ewing, previously known as Trenton Junction for its association with the construction of a nearby train station in 1881 (Falzini 2017:Chapter 2). By 1890, Summit Avenue and the adjacent streets had been laid out in a small grid and the lots subdivided. Development within the subdivided area, however, was relatively sparse and concentrated along Bear Tavern Road and Grand Avenue (Scarlet & Scarlet 1890). This residential area, totaling about 1 square mile, developed over the first half of the twentieth century with single-family homes. This development was encouraged largely by the increase of transit options which connected the suburb of Ewing to the adjacent city of Trenton, including more direct train service to Trenton Junction and the introduction of trolleys (Falzini 2017:Chapter 3).

In 1940, the block of Summit Avenue between present-day Howell Avenue and Decou Avenue (containing the subject parcel) was lined on both sides with trees and encompassed six single-family houses, all of which were located along the north side of the street. The south side at this time was open land (NETR 1940). At some point between 1940 and 1947, the series of lots bordering the north side of Summit Avenue were developed with single-family houses (NETR 1940, 1947). By 1947, the extant dwelling had been constructed. This vernacular house was constructed in the Cape Cod form, which was a common subset of the Colonial Revival in the mid-twentieth century, particularly after 1910. This modest, single-story form typically had a side-gabled roof and central chimney (McAllister 2013:410–411). In 1950, the house was inhabited by Raymond Hutchinson, a sub-station operator for public utilities, and his wife Elsie. According to census records, Summit Avenue at this time was populated by members of the middle class who worked across industries as engineers, business owners, accountants, and clerks (United States Census Bureau 1950).

The dwelling at 106 Summit Avenue has remained a residence throughout its history. While there are no major alterations to the building's form, its doors and windows were replaced, and the exterior reclad in vinyl siding and stone veneer at some point in the late twentieth century.

Form: Bungalow **Stories:** 1.5
Type: N/A **Bays:** 3
Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Vinyl Siding

Exterior Description, continued from Base Survey Form:
The dwelling is sheathed in vinyl siding below the asphalt-shingled, side-gabled roof. A central interior chimney rises from the rear slope of the roof just northwest of the ridgeline. The front slope of the roof descends sharply over the central and south bays of the primary (southeast) elevation, where it shelters an inset porch supported by turned wood replacement posts spanned by a replacement railing consisting of turned wood balusters. The porch shelters the central entrance, which consists of a paneled wood replacement door behind a vinyl storm door flanked by inoperable vinyl shutters. Windows throughout consist of single, paired, or triple double-hung vinyl units arranged in symmetrical fenestration pattern. There is a picture window flanked by one-over-one, double hung windows in the northeastern bay of the primary elevation. There are two dormers containing six-over-six, double-hung replacement windows on the primary elevation. The westernmost dormer is considerably larger than the easternmost dormer and is positioned over a partial-width engaged front porch. Both dormers were added between 2008 and 2012. The windows on the remaining elevations are one-over-one units. On the northeast and southwest elevations, the windows are arranged in similar fenestration patterns with two windows on the first floor and a paired window unit in the gable end. On the primary elevation, the windows are flanked by inoperable vinyl shutters. There is a secondary entrance on the rear addition at the southwestern end of the rear (northwest) elevation, which also likely consists of a replacement door. The rear addition is clad in painted, vertical wood plank and is topped by an asphalt-shingle shed roof. The dwelling sits on a concrete block foundation. The rear (northwest) elevation was not accessible via public right-of-way.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject dwelling is sited on a 0.23-acre, rectangular parcel. The primary elevation faces southeast and is set back approximately 65 feet from Summit Avenue. An asphalt-paved driveway runs from Summit Avenue along the southwest elevation of the dwelling. A concrete-paved pathway connects the driveway to the front entrance. A shed is located approximately 100 feet northwest of the dwelling. The surrounding context consists of early and mid-twentieth-century dwellings.

Builder: Unknown **Remaining Historic Fabric:** High
Style: Other
Form: Other **Stories:** 1
Type: Shed **Bays:** 1
Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Vinyl Siding

Exterior Description:
The shed at 104 Summit Avenue is a small, frame structure located at the northwest edge of the property. This one-story building is topped by a side-gabled, asphalt-shingle roof with a low pitch and an overhanging eave over the southeast elevation. The shed appears to be clad in painted wood plank, with some exposed framing in the gable end. An entrance is located on the southeast elevation. This shed was largely obstructed from view from the public right-of-way.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The primary elevation of the shed faces southeast and is set back approximately 210 feet from Summit Avenue and 100 feet from the dwelling. An asphalt-paved driveway runs from Summit Avenue along the southwest elevation of the dwelling. A concrete-paved pathway connects the driveway to the front entrance. The shed is bordered by several shrubs and trees, particularly on its northwest and northeast elevations. The surrounding context consists of early and mid-twentieth-century dwellings.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
104 Summit Avenue is an example of a mid-twentieth-century vernacular dwelling and shed built in the neighborhood of West Trenton in Ewing, Mercer County. West Trenton, formerly known as Trenton Junction, developed over the course of the late nineteenth and early twentieth centuries as one of Ewing's earliest subdivisions. Its growth was largely attributed to the expansion of local rail transit which connected the Trenton Junction neighborhood of Ewing to the city of Trenton. The subject building was one of several vernacular dwellings which were constructed along Summit Avenue in the 1940s.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
104 Summit Avenue is recommended not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with any significant persons or events to qualify under NRHP Criteria A or B. The property is an unremarkable example of a 1940s dwelling commonly found in the area and does not possess sufficient significance to warrant NRHP-eligibility under Criterion C. In addition, alterations have been made, including the construction of a rear addition in (date), the construction of the facade dormers between 2008 and 2012, and the replacement of doors, windows, and siding, all of which diminish property's integrity. For these reasons, 104 Summit Avenue is recommended not eligible for listing in the NRHP under Criteria A, B, or C. The building was not evaluated under NRHP Criterion D.

CONTINUATION SHEET

Historic Sites #:

History:

The dwelling at 104 Summit Avenue is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (Trenton Evening Times, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; NETR 1931, 1947, 1963, 1970).

Summit Avenue is a primarily residential street located in Ewing Township, Mercer County, in the area commonly known as West Trenton. By 1890, Summit Avenue and the adjacent streets had been laid out in a small grid and the lots subdivided. Development within the subdivided area, however, was relatively sparse and concentrated along Bear Tavern Road and Grand Avenue (Scarlet & Scarlet 1890). This residential area, totaling about 1 square mile, developed over the first half of the twentieth century with single-family homes. This development was encouraged largely by the increase of transit options which connected the suburb of Ewing Township to the adjacent city of Trenton (Falzini 2017:Chapter 3).

In 1940, the block of Summit Avenue between present-day Howell Avenue and Decou Avenue (containing the subject parcel) was lined on both sides with trees and encompassed six single-family houses, all of which were located along the north side of the street. The south side at this time was open land (NETR 1940). At some point between 1940 and 1947, additional lots bordering the north side of Summit Avenue, including the subject property, were developed with single-family houses (NETR 1940, 1947). In 1950, Joseph R. Kanyuh, a refrigerator mechanic in the dairy industry, resided in the house with his wife Anastasia, who worked as a stenographer for the New Jersey Department of Transit. According to census records, Summit Avenue at this time was populated by members of the middle class who worked across industries as engineers, business owners, accountants, and clerks, likely indicating the block's development in association with the area's military and industrial growth during the period (United States Census Bureau 1950).

104 Summit Avenue remained a residence throughout its history. Around 1965, a small shed was constructed at the rear edge of the property, and around 2006, a one-story, wood-plank, shed-roof addition was added to the west side of the dwelling's rear elevation (NETR 1963, 1968, 2006). Additionally, it appears that the dwelling's dormers were added between 2008 and 2012, and the doors and windows were replaced and the exterior reclad in vinyl siding at some point in the late twentieth century.

Exterior Description, continued from Base Survey Form:
The exterior of the dwelling is clad in vinyl siding. The dwelling is capped with a side-gabled roof sheathed in asphalt shingles, which is pierced at the center of the northwestern roof slope by a brick chimney. The northeastern bay of the primary (southeastern) elevation projects slightly and is topped by a front gable. There is a partial-width engaged porch which occupies the southwestern and central bays encircled by turned wood posts and a railing. The primary entryway is located at the center of the southeast elevation within the entry porch and consists of a paneled wood replacement door and vinyl storm door, which are set in carved wood surrounds and are accessed by three concrete-and-brick steps. There is a secondary entrance on a small porch at the southwestern end of the rear (northwest) elevation, which also likely consists of a replacement door and is sheltered by an asphalt-shingle shed roof. The windows throughout consist of one-over-one, double-hung vinyl units and are arranged in symmetrical fenestration patterns. In the southwestern bay of the primary elevation, there is a picture window flanked by one-over-one, double hung windows. The windows on the primary elevation contain stylistic vinyl ornament, such as inoperable shudders and vinyl arches. On the northeast and southwest elevations, the windows are arranged in similar fenestration patterns with two windows on the first floor and a paired window unit in the gable end. The main block of the dwelling sits on a concrete block foundation, while the porch sits atop a brick foundation. The rear (northwest) elevation was not accessible via public right-of-way.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject dwelling is sited on a 0.23-acre, rectangular parcel. The primary elevation faces southeast and is set back approximately 60 feet from Summit Avenue. An asphalt-paved driveway runs from Summit Avenue along the southwest elevation of the dwelling, terminating in a paved parking area at the rear of the dwelling. A concrete-paved pathway inlaid with paving stones extends northwest from Summit Avenue to the front entrance. A garage is located approximately 50 feet northwest of the dwelling. The surrounding context consists of early and mid-twentieth-century dwellings.

CONTINUATION SHEET

Historic Sites #:

History:

The dwelling at 102 Summit Avenue is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (Trenton Evening Times, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (NETR 1931, 1947, 1963, 1970; Ewing Township Planning Board 2006; Mueller 1918).

Prior to the construction of the subject dwelling, the subject property did not contain any buildings (NETR 1940). Summit Avenue is located within the West Trenton neighborhood of Ewing, previously known as Trenton Junction for its association with the construction of a nearby train station in 1881 (Falzini 2017:Chapter 2). By 1890, Summit Avenue and the adjacent streets had been laid out in a small grid and the lots subdivided. Development within the subdivided area, however, was relatively sparse and concentrated along Bear Tavern Road and Grand Avenue (Scarlet & Scarlet 1890). This residential area, totaling about 1 square mile, developed over the first half of the twentieth century with single-family homes. This development was encouraged largely by the increase of transit options which connected the suburb of Ewing to the adjacent city of Trenton, including more direct train service to Trenton Junction and the introduction of trolleys (Falzini 2017:Chapter 3).

In 1940, the block of Summit Avenue between present-day Howell Avenue and Decou Avenue (containing the subject parcel) was lined on both sides with trees and encompassed six single-family houses, all of which were located along the north side of the street. The south side at this time was open land (NETR 1940). At some point between 1940 and 1947, the series of lots bordering the north side of Summit Avenue were developed with single-family houses (NETR 1940, 1947). By 1947, the extant dwelling and garage had been constructed. In 1950, the house was inhabited by Chester Bucklad, a sales engineer for commercial refrigeration, his wife Lella, and their children Beverly and Norman. According to census records, Summit Avenue at this time was populated by members of the middle class who worked across industries as engineers, business owners, accountants, and clerks (United States Census Bureau 1950).

102 Summit Avenue remained a residence throughout its history. Between 1979 and 2002, the front and rear porches were added to the dwelling (NETR 1979, 2002). Additionally, it appears that both the dwelling and garage's doors and windows were replaced, and their exteriors reclad in vinyl siding at some point in the late twentieth century.

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

1523–1525 Parkway Avenue is a 0.643-acre, rectangular lot containing two circa-1965 commercial buildings (Plates 1–3). Both buildings are set back approximately 80 feet and have narrow rectangular footprints. The two buildings flank a central driveway which extends south from Parkway Avenue and bisects the property. The parcel is largely paved in asphalt with parking areas in the front (north) and rear (south) of the buildings. There are sections of grass lawn along Parkway Drive, and mature trees line the rear and east edge of the lot.

Designer: Unknown **Physical Condition:** Good
Builder: Unknown **Remaining Historic Fabric:** Medium
Style: None
Form: Other **Stories:** 1.5
Type: N/A **Bays:** 4
Roof Finish Materials: Sheet Aluminum
Exterior Finish Materials Concrete block, modern

Exterior Description:
1523 Parkway Avenue is a circa-1965, one-and-a-half story building with a rectangular footprint (see Plates 1, 3). This building is topped by a front-gabled, standing-seam metal roof and is constructed of modern concrete block which is clad in brick veneer on the northern section of the building. The front gable is filled with vertical vinyl siding, and an additional band of vertical vinyl siding wraps around the building along the base of the roofline. The primary entrance is located in the westernmost bay of the primary (north) elevation and consists of a glazed, wood replacement door and vinyl storm door and is elevated by one step from grade. There is a metal utility door on the east elevation. Two double-sash, likely casement vinyl replacement windows are located on the first story of the primary elevation. These two windows and the primary entrance are topped by an offset vinyl gable, which is infilled with vertical vinyl siding. There is an additional triple-sash vinyl replacement window, either containing fixed or hopper sashes, located in the primary elevation's gable end. Window openings on the west elevation are located along the top of the elevation and are infilled with glass blocks which were likely installed in the late twentieth century. Based on the obstructed view of the building from the public right-of-way, it appears that the east elevation contains no fenestration, and the rear elevation was not visible. The building sits atop a concrete foundation.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject building is sited near the eastern boundary of the 0.643-acre parcel. The primary elevation faces north and is set back approximately 80 feet from Parkway Avenue. The building is bounded on the north by an asphalt-paved parking area, the east and south by grass, and the west by the driveway which connects the parking area at the rear of the parcel to Parkway Avenue. The surrounding area is characterized largely by mid-twentieth-century commercial and industrial development.

Roof Finish Materials: Rolled Asphalt
Exterior Finish Materials Concrete block, modern

Exterior Description:
1525 Parkway Avenue is a circa-1965, one story building with a rectangular footprint (see Plates 2, 3). This building is topped by a flat, rolled asphalt roof with small parapets. These parapets are pierced on the east and west elevation by numerous gutters, which extend downwards from the roof to the ground. The building is constructed of concrete block which is clad in brick veneer on the primary (north) elevation. The front elevation is sheltered by a wood-shingled awning. The primary entrance is located in the easternmost bay of the primary elevation and consists of a metal door in metal surrounds, which is elevated by one concrete step. There is an additional metal door on the east elevation alongside a roll-top metal garage door. The two western bays on the primary elevation are filled with forty-light, fixed windows which are covered by metal bars and feature brick sills and lintels. The building sits atop a concrete foundation. The rear elevation was not visible from the public right-of-way.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject building is sited near the western boundary of the 0.643-acre parcel. The primary elevation faces north and is set back approximately 80 feet from Parkway Avenue. The building is bounded on the north by an asphalt-paved parking area, the west and south by grass, and the east by the driveway which connects the parking area at the rear of the parcel to Parkway Avenue. A metal fence runs along the western edge of the parcel and separates the subject building from the neighboring gas station. The surrounding area is characterized largely by mid-twentieth-century commercial and industrial development.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
1523–1525 Parkway Avenue is an example of a mid-twentieth-century commercial property containing two concrete block buildings built in Ewing, Mercer County. In the mid-twentieth century, the area surrounding the subject property was predominantly industrial, characterized by the presence of the Aeronautical Turbine Laboratory/Naval Air Warfare Center Aircraft Division-Trenton, the Delaware and Bound Brook (Reading) Railroad Historic District (SHPO Opinion: 9/9/2005), the General Motors (GM) Inland Fisher Guide Plant, and various smaller warehouses and automotive service shops. The subject parcel was used in the latter half of the twentieth century to service the automotive industry and was later converted into a dance studio in the twenty-first century.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
1523–1525 Parkway Avenue is recommended not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with any significant persons or events to qualify under NRHP Criteria A or B. The property is an unremarkable example of a 1960s commercial property commonly found in the area and does not possess sufficient significance to warrant NRHP eligibility under Criterion C. In addition, alterations have been made, including the replacement of doors, windows, and siding, diminishing the integrity of the property. For these reasons, 1523–1525 Parkway Avenue is recommended not eligible for listing in the NRHP under Criteria A, B, or C. The building was not evaluated under NRHP Criterion D.

CONTINUATION SHEET

Historic Sites #:

History:

The commercial buildings at 1223–1525 Parkway Avenue are located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (Trenton Evening Times, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more development in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; NETR 1931, 1947, 1963, 1970).

The subject parcel was developed with its two commercial buildings at some point between 1963 and 1969 (NETR 1963, 1969). Following World War II, the stretch of Parkway Avenue between Decou Avenue and Penny Lane was largely industrial in character. Situated on the north side of Parkway Avenue, the Aeronautical Turbine Laboratory/Naval Air Warfare Center Aircraft Division-Trenton (ATL/NAWCAD-Trenton) was operated during this time by the Navy to test a variety of engine types and contribute to the development of military technology for the Cold War (Louis Berger & Associates Inc. 1996:20). In addition to this sizable industrial property, the General Motors (GM) Inland Fisher Guide Plant and the Delaware and Bound Brook (Reading) Railroad, both of which sat approximately 825–900 feet east of the subject property in the mid-twentieth century, contributed to the industrial character of the area at the time.

When the subject parcel was developed in the mid-1960s, it was flanked on the west by a gas station and/or auto repair center and on the east by a warehouse with prominent loading docks (NETR 1969). The subject property was built up with two rectangular concrete block buildings. Aerial imagery dating to the 1970s suggests that these buildings operated as auto repair shops, storing several automobiles on the site (NETR 1971, 1979). The buildings' simple concrete block construction and the presence of roll-top garage doors on 1525 Parkway Avenue corroborate this likely commercial use. The property was sold in 2001, and after this transaction it appears that the buildings' use in the automobile industry ceased (Mercer County Clerk Office [MCCO] 2001, Deeds, 4117:244; NETR 2002). Tax records indicate that at some point in the early twenty-first century, the individual buildings located on the 0.643-acre lot were subdivided out from the greater parcel so that each building could be sold to different owners. Even after this subdivision occurred, all three parcels (the greater parcel and the two individual buildings) remain grouped under the same single block and lot designation (Njparcels.com 2024). In 2010, 1523 Parkway Avenue was sold to new owners and opened as the American Ballroom Company, a dance studio (MCCO 2010, Deeds, 6085:96). 1525 Parkway Avenue was owned by a single owner in the final decades of the twentieth century and was sold to its current owner in 2012 (MCCO 2012, Deeds, 6152:1448). 1523 Parkway Avenue was sold in 2021 and no longer appears to operate as a dance studio (MCCO 2021, Deeds 6456:1610).

Since their construction, the subject buildings have undergone moderate alteration, particularly 1523 Parkway Avenue. Both buildings retain their original footprint and massing, but it appears that vinyl siding and new roofing material were added to 1523 Parkway Avenue since the time of construction. Additionally, it is likely that the vinyl gable on the primary elevation of 1523 Parkway Avenue, along with the primary door and several windows, was added in the late twentieth or early twenty-first centuries.

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

Built circa 1955, 1515 Parkway Avenue is a raised, one-story-tall, concrete block warehouse building (Plates 1–4). The building has an irregular footprint made up of a circa-1955, rectangular main block with a circa-1960 rear (southwest) addition, a series of circa-1965 rear, southeast, and northwest additions, and a 1971 northwest addition. The building is topped with a flat roof covered in what appears to be rubber membrane throughout. A concrete block parapet wall with terracotta tile coping lines the roof of the main block with a break in the parapet wall on the primary (northeast) elevation. Windows are all fixed vinyl replacement units. Doors are primarily single and paired metal units with metal roll-top units located in the garage bays. Fenestration is asymmetrical throughout. *See Building/Element Attachment*

Roof Finish Materials: Rubber Membrane
Exterior Finish Materials Concrete Block, Modern

Exterior Description, continued from Base Survey Form:
The primary elevation of the main block is four bays wide with the main entrance located in the second easternmost bay. It contains a metal-framed door with glazing and is accessed by a concrete stoop with metal pipe railings. The two westernmost bays contain loading docks with garage bays. A flat-roof overhang extends along the roofline of the primary elevation sheltering all four bays. The northwest elevation of the main block is primarily obstructed by the northwest circa-1965 addition; however, an additional entrance is located in the junction of the main block and northwest addition. It is accessed by a concrete loading dock that is sheltered by a flat-roof overhang supported by square, wood posts. The overhang and loading dock extend the full length of the addition's primary elevation, and the overhang shelters another entrance in the addition's eastern bay and a wood-panel roll-top garage door in the western bay. The circa-1965 addition's northwest elevation is void of fenestration. Two more garage bays are located in the eastern bays of the circa-1965 southeast addition and a pedestrian entrance is located in the western bay. They are all accessed by a recessed concrete loading dock and covered by a flat-roof overhang with metal posts. A single garage bay is located on the primary elevation of the 1971 addition. The rear elevation of the building was not visible from the public right-of-way.

Interior Description:
The subject property is a privately owned parcel. As sub-consultants, Richard Grubb & Associates, Inc.'s access was limited to the public right-of-way and did not include interior access to the building.

Setting:
The building at 1515 Parkway Avenue is sited on multiple rectangular parcels (Block 375, Lots 7–11) on the southwest side of Parkway Avenue in Ewing Township, Mercer County, New Jersey. The building is set back approximately 58 feet from the road and is lined by a concrete sidewalk on the northeast border. Asphalt-paved parking lots surround the building to the northwest, northeast, and southeast. Mature trees line the southwest border of the property. The subject property is primarily surrounded by mid-twentieth-century commercial, industrial, and residential buildings.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
The warehouse building at 1515 Parkway Avenue was built circa 1955 in Ewing Township, Mercer County, New Jersey. It originally housed the business of Caldwell Supply Co., a wholesale distributor, until the business was relocated in 1985. The building later operated as a tire warehouse during the twenty-first century. Since its initial construction, it was expanded multiple times with several additions built between circa 1960 and 1971. It has also undergone some modern alterations, including the replacement of windows and doors. Overall, the building is a typical and unremarkable example of a mid-twentieth-century warehouse.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
The warehouse building at 1515 Parkway Avenue is not recommended eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with prominent individuals or patterns of history. Architecturally, the building retains a high degree of integrity of location, setting, feeling, and association; however, it is a common and unremarkable example of its type, and it is not the work of a master. Furthermore, the several mid-twentieth-century additions and the replacement of the windows and doors has diminished its integrity of design, workmanship, and materials. For these reasons, 1515 Parkway Avenue is recommended not eligible for listing in the NRHP under Criteria A, B, or C.

CONTINUATION SHEET

Historic Sites #:

History:

Constructed circa 1955, the warehouse building at 1515 Parkway Avenue is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (Trenton Evening Times, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more development in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development (NETR 1931, 1947, 1963, 1970; Ewing Township Planning Board 2006; Mueller 1918). Located just south of the airport, the subject property at 1515 Parkway Avenue first appears on a 1957 aerial (NETR 1957). Likely constructed to house Caldwell Supply Co., a wholesale distributor of farm fertilizers, lawn and garden supplies, and pet food, that began operation in Ewing Township during the 1940s, the building originally consisted of just the rectangular main block (Trentonian, 21 August 1985:29; NETR 1957).

Shortly after it was constructed, between 1958 and 1963, the first addition was constructed on the rear elevation of the building (NETR 1958, 1963). By 1969, another rear addition, a southeast addition, and the first northwest addition were built (NETR 1969). Two years later, in 1971, the last addition was added to the northwest elevation (NETR 1971). The building continued to house Caldwell Supply Co. until the mid-1980s, when the company was relocated to Hazelton, Pennsylvania (Figure 1; Trentonian, 21 August 1985:29; The Times, 24 April 2012:6). Since the late twentieth century, minimal alterations appear to have been made to the exterior of the building. Based on stylistic evidence, the windows and doors were likely replaced sometime during the early twenty-first century. From approximately 2008 to circa 2018, the building operated as a tire warehouse for Traction Tire (Google, Inc. 2008, 2018). Today the building is vacant.

Description:

1505 Parkway Avenue is a 0.56-acre lot containing two 1971 commercial buildings (Plates 1–4). Building A is set back from Parkway Avenue approximately 98 feet, while Building B is set back approximately 230 feet. An asphalt-paved driveway extends south from Parkway Avenue, runs along the west side of Building A, and terminates in an asphalt-paved parking lot between Building A and Building B. The Delaware and Bound Brook (Reading) Railroad Historic District (SHPO Opinion: 9/9/2005) is located approximately 145 feet east of the subject property. The surrounding area consists primary of early to mid-twentieth-century commercial and industrial properties.

Common Name: Building A, 1505 Parkway Avenue
Historic Name: Building A, 1505 Parkway Avenue
Present Use: Commercial Activity, Malls and Shopping Centers
Historic Use: Commercial Activity, Malls and Shopping Centers
Construction Date: 1971 **Source:** Nationwide Environmental Title Research (NETR) 1971
Alteration Date(s): Late twentieth Century **Source:** Stylistic Evidence
Designer: Unknown **Physical Condition:** Good
Builder: Unknown **Remaining Historic Fabric:** Medium
Style: None
Form: Commercial **Stories:** 1
Type: N/A **Bays:** 8
Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Concrete block, modern

Exterior Description:
Building A at 1505 Parkway Avenue is a 1971, one-story building with a rectangular footprint (see Plates 1–3). This building is topped by a side-gabled, asphalt-shingled roof, which is pierced by a commercial roof exhaust fan at the western end of the north slope. The building is constructed of concrete block with sections of vinyl siding in the gable ends. The primary (north) elevation is clad in brick veneer. The building contains four businesses, and the division of these four separate spaces is reflected in the fenestration along the primary elevation. Each business is accessed through a half-glazed, crossbuck wood door, which is located next to a vinyl, picture window flanked by one-over-one, double-hung windows and topped by a commercial sign. The easternmost window is protected by metal security bars, and the door features a glazed, vinyl replacement storm door. The fenestration along the primary elevation is symmetrical. Each of the four businesses housed by the building has a door and commercial window. There are five additional entrances on the rear (south) elevation, which include metal doors and vinyl doors, some with paneled details, many capped with concrete lintels with a row of brick headers above. Two former garage door openings have been infilled, one with wood paneling and one with a pair of metal doors. There is a single, one-over-one, double hung window on the west elevation. The building has a concrete foundation.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject building is sited along the front (north) of the 0.56-acre, irregular parcel. The primary elevation faces north and is set back approximately 98 feet from Parkway Avenue. An asphalt-paved driveway extends from Parkway Avenue along the west side of the building and accessed parking lots abutting the building to the north and south. There is a masonry retaining wall and concrete bollards lining the northern edge of the parking lot. A concrete sidewalk runs along the primary elevation. The east side of the building looks onto grass lawn with some scattered trees.

Common Name: Building B, 1505 Parkway Avenue
Historic Name: Building B, 1505 Parkway Avenue
Present Use: Commercial Activity, Office activity- private business
Historic Use: Commercial Activity, Office activity- private business
Construction Date: 1971 **Source:** NETR 1971
Alteration Date(s): N/A **Source:** N/A
Designer: Unknown **Physical Condition:** Good
Builder: Unknown **Remaining Historic Fabric:** High
Style: Modernistic
Form: Other **Stories:** 1
Type: N/A **Bays:** 6
Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Concrete block, modern

Exterior Description:
Building B at 1505 Parkway Avenue is a 1971, one-story building with a rectangular footprint (see Plate 4). This building is topped by a side-gabled, asphalt-shingled roof, with overhanging eaves and projecting gable ends. At the base of the roofline, the eaves and gable ends are enclosed by a band of vertical wood plank siding that forms a simple frieze. The building is primarily constructed of concrete block. The primary (north) elevation is clad in textured and scored concrete, which is interrupted by six bays containing windows and doors. Starting at the west end of the building, the first, third, and fifth bays contain entrances, each containing an offset metal door and textured glass sidelight in metal surrounds. The remaining bays each contain a metal window unit with a one-light fixed window above and a smaller, operable window below. Vertical wood cladding is located above the doors and above and below the windows. There is an additional metal door located on the east elevation. The building has a concrete foundation. The rear elevation was not visible from the public right-of way.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject building is sited at the rear (south) of the 0.56-acre parcel. The primary elevation faces north and is set back approximately 230 feet from Parkway Avenue. The building is located approximately 67 feet behind Building A and looks onto an asphalt-paved parking lot which is connected to Parkway Avenue by an asphalt driveway. A concrete sidewalk runs along the building's primary elevation. The building is bordered to the south by several mature trees, with some sections of grass on the east and west sides.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
1505 Parkway Avenue is an example of a mid-twentieth-century commercial property containing two concrete block buildings built in Ewing, Mercer County. In the mid-twentieth century, the Parkway Avenue corridor in the area of the subject property included a mix of commercial and industrial uses, including the Aeronautical Turbine Laboratory/ Naval Air Warfare Center Aircraft Division-Trenton, the Delaware and Bound Brook (Reading) Railroad Historic District (SHPO Opinion: 9/9/2005), the General Motors (GM) Inland Fisher Guide Plant, and various smaller commercial businesses. The subject parcel was developed in 1971 to house several commercial operations, which over the years have included offices, restaurants, and salons. The subject property has maintained this use consistently since its construction.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
1505 Parkway Avenue is recommended not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with any significant persons or events to qualify under NRHP Criteria A or B. The property is an unremarkable example of a 1970s commercial property commonly found in the area and does not possess sufficient significance to warrant NRHP eligibility under Criterion C. In addition, alterations have been made, including the replacement of doors and windows, and the installation of a new roof type, diminishing the integrity of the property. For these reasons, 1505 Parkway Avenue is recommended not eligible for listing in the NRHP under Criteria A, B, or C. The building was not evaluated under NRHP Criterion D.

CONTINUATION SHEET

Historic Sites #:

History:

The commercial buildings at 1505 Parkway Avenue are located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (Trenton Evening Times, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more development in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (NETR 1931, 1947, 1963, 1970; Ewing Township Planning Board 2006; Mueller 1918).

The subject property consists of two commercial buildings, which were both constructed in 1971 (NETR 1970, 1971). Following World War II, the stretch of Parkway Avenue in between Decou Avenue and Penny Lane was largely industrial in character. Situated on the north side of Parkway Avenue, the Aeronautical Turbine Laboratory/Naval Air Warfare Center Aircraft Division-Trenton (ATL/NAWCAD-Trenton) was operated during this time by the Navy to test a variety of engine types and contribute to the development of military technology for the Cold War (Louis Berger & Associates, Inc. 1996:20). In addition to this sizable industrial property, the Delaware and Bound Brook (Reading) Railroad ran in proximity to the subject property along its east side. On the opposite side of the railroad corridor from the subject property was the General Motors (GM) Inland Fisher Guide Plant, which operated automobiles throughout the latter half of the twentieth century (Lewis 2021). Interspersed throughout these industrial properties, commercial properties were also developed to serve Ewing's residents. Throughout the mid-twentieth century, Ewing's population increased, and a wave of suburbanization resulted in widespread residential and commercial development.

When the subject parcel was developed in 1971, it was situated between the Reading Railroad corridor on the east and a commercial building on the west (NETR 1971). Building A contains commercial spaces that can be adapted to accommodate various retail, restaurant, and personal services uses, while Building B appears to contain more office spaces. Aerial imagery from the 1970s reveals that Building A was constructed with a flat roof. This roof was replaced with the current, side-gabled roof in around 2006 (NETR 2004, 2006). This commercial property has been owned by a single owner, also residing in Ewing, for the majority of its history, and the individual commercial spaces have been leased out regularly (Njparcels.com 2024). Some of the businesses that were housed in Building A in the twenty-first century include a Mexican restaurant, an Italian restaurant, an insurance agency, a hair salon, and a nail salon (Google, Inc. 2008, 2018).

Building A appears to have undergone various alterations in the late twentieth and early twenty-first centuries, such as the replacement of doors and windows, as well as the installation of a new roof type around 2006. Building B appears to have undergone minimal alteration and retains a high degree of integrity.

BASE SURVEY FORM

Historic Sites #:

Property Name: 1252 Parkway Avenue

Street Address: *Street #:* 1252 (Low) _____ (High) *Apartment #:* _____ (Low) _____ (High)

Prefix: _____ *Street Name:* Parkway *Suffix:* _____ *Type:* AVE

County(s): Mercer **Zip Code:** 08628

Municipality(s): Ewing Township **Block(s):** 364

Local Place Name(s): West Trenton **Lot(s):** 73

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

1252 Parkway Avenue is a circa-1955, one-story tall, four-bay-wide gas and service station with a rectangular footprint (Plates 1–5). At the time of fieldwork for this survey form, this former gas station was in the process of being demolished or heavily renovated. The building has exposed concrete block walls and a flat roof covered with rolled asphalt. Short parapet walls rise above the level of the roof on the northwest, northeast, and southeast elevations. Three wide, open garage bays fill more than half of the primary (southwest) elevation, which faces Parkway Avenue. The garage door openings in the center two bays are topped by wood lintels. The southeastern bay is constructed of lighter concrete blocks and features a steel lintel in the garage bay, suggesting that this section of the building was added after 1955. The western bay originally held the lobby and storefront, and the large glass windows have been removed from the nearly full-height opening. Only a metal pole at the corner of the building supports the upper portion of the concrete block walls on the southwest and northwest elevations. *See Building/Element Attachment*

Roof Finish Materials: Rolled asphalt

Exterior Finish Materials Concrete block, modern

Exterior Description, continued from Base Survey Form:
The southeast elevation contains two metal-framed window openings with concrete sills. The northwest elevation features two tall, rectangular pedestrian door openings which sit beneath a continuous wood lintel. The rear elevation has two window openings that have been filled in with painted concrete block. The service station sits on a poured concrete foundation. Approximately 20 feet southwest of this building, there is a replacement metal canopy structure and circa-2023 attendant booth.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:
The subject building is sited on a 0.530-acre, irregular parcel. The primary elevation faces southwest and is set back approximately 75 feet from Parkway Avenue. The subject parcel is located on the eastern corner of the intersection between Parkway Avenue (County Route 634) and Scotch Road (County Route 611). The majority of the subject parcel is paved in asphalt, with some sections of concrete paving, particularly under the canopy. The property is connected to Scotch Road by an asphalt-paved driveway on the northwest side, and it is connected to Parkway Avenue at two locations along the parcel's southwest boundary by curb cuts. Grass lawn is located at the parcel's western corner and along the northeastern edge. Mature trees line the property's southeastern edge. The surrounding context consists of mid- to late twentieth-century commercial buildings with some early to mid-twentieth-century dwellings.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
1252 Parkway Avenue is a common example of a mid-twentieth-century gas and service station built in Ewing Township, Mercer County. In the postwar period, the township of Ewing underwent a period of suburbanization that came with a surge in population and associated commercial and residential development. The Parkway Avenue corridor was heavily built up during this period with a variety of commercial businesses which served both residents of Ewing and the automobile traffic along Parkway Avenue. The subject property was one of several gas stations which were constructed along Parkway Avenue in the postwar period.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
1252 Parkway Avenue is recommended not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with any significant persons or events to qualify under NRHP Criteria A or B. The property is an unremarkable example of a mid-1950s gas and service station commonly found in the area and does not possess sufficient significance to warrant NRHP-eligibility under Criterion C. In addition, the integrity of the property is severely diminished by its ongoing demolition. For these reasons, 1252 Parkway Avenue is recommended not eligible for listing in the NRHP under Criteria A, B, or C. The building was not evaluated under NRHP Criterion D.

CONTINUATION SHEET

Historic Sites #:

History:

The gas and service station at 1252 Parkway Avenue is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (Trenton Evening Times, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more development in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; NETR 1931, 1947, 1963, 1970).

Prior to 1950, the area along Parkway Avenue to the east of Scotch Road, encompassing the subject property, was still primarily undeveloped land. Between 1947 and 1953, there was a notable increase in construction along Parkway Avenue in the area of the subject parcel, although this development was limited to individual lots or contained blocks (NETR 1947, 1953). Likely built in response to the increasing development in the surrounding area, the subject gas and service station at 1252 Parkway Avenue was constructed circa 1955. Around the time of its construction, the Parkway Avenue corridor to the west of Scotch Road was extensively built up with commercial and industrial buildings and structures (NETR 1957). A new subdivision comprising nearly identical, single-family homes lining a newly built network of streets was also developed to the northeast of the property. The southwest corner of the intersection between Scotch Road and Parkway Avenue, diagonally opposite the subject parcel, was dominated by the General Motors (GM) Inland Fisher Guide Plant which manufactured automobile parts throughout the latter half of the twentieth century (Lewis 2021).

The subject gas and service station was built at the heavily trafficked intersection between Scotch Road and Parkway Avenue. Asphalt driveways connected the parcel to both roadways, providing efficient vehicular access for passing motorists. Based on aerial imagery from the late twentieth century, it appears that the gas station's general form remained largely unaltered from its construction to present day, with the exception of one added service bay. At some point between 1984 and 1995, a canopy was constructed to shelter the gas pumps, which sit to the south of the main building (NETR 1984, 1995). The building was sold four times between 1992 and 2022 and remained in use as a gas and service station during this period (Njparcels.com 2024). Between 2011 and 2013, the gas and service station was rebranded from Liberty Gas Station to Eagle Gas Station, which involved changing the signage on the building and canopy. The property remained in the same ownership during this time, despite the change of business or business name. The business remained an Eagle Gas Station until it closed in 2019 (Google Streetview 2011, 2013, 2019).

At the time in which this survey form was completed (2024), the subject building was in the process of being demolished or heavily renovated, possibly due to a fire. According to Google Streetview imagery from 2023, the garage door openings were previously filled with 12-light, metal framed roll top doors which were likely installed in the twenty-first century, and the opening at the western corner was enclosed in plate glass and featured a glazed, metal-framed commercial door on the southwest elevation. The pedestrian door openings on the northwest elevation contained metal doors with rectangular transom lights. The window openings on the southeast elevation contained multilight metal windows. There was formerly an overhanging eave which extended over all elevations, and the building was clad in stucco with some commercial signage.

Municipality(s): Ewing Township **Block(s):** 364.01

Local Place Name(s): West Trenton **Lot(s):** 25

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

The Ewing Cemetery and Crematory occupies an irregularly shaped 29.3-acre plot of land. The cemetery is bounded by Scotch Road to the northwest, residences along Shelton Avenue to the southwest, a wooded area along the West Branch of Shabakunk Creek to the southeast, and Carlton Avenue to the northeast (Plates 1–32). The main entrance to the cemetery is located along Scotch Road, adjacent to the southwest of the 1933 Ewing Crematorium. Scotch Road is bordered by a random uncoursed ashlar stone wall, featuring replacement metal gates at the main entrance. An asphalt parking lot, adjacent to the northeast of the crematorium, is accessed from Scotch Road. The asphalt-paved roadway network within the burial ground consists of a rectangular bordering road, bisected longitudinally by a central road with two circular segments built to surround fountains, and two interior road segments to the southwest forming a triangle.

Description:

The Ewing Cemetery and Crematory is situated on a 29.3-acre parcel on the southeast side of Scotch Road between Shelton Avenue and Carlton Avenue. The 1933 Crematorium, also housing the Ewing Cemetery Association offices and caretaker's residence, faces Scotch Road at the western edge of the property. The cemetery's burials are laid out in a grid pattern throughout, generally oriented northwest–southeast. The oldest gravestones are in the northern section of the cemetery, and in general, the burials become more recent towards the south, with open space remaining at the south end of the burial ground, as well as in the northeast corner. A 1962 fountain stands at the center of the burial ground, featuring a central stone pedestal and reflecting pool bounded by stone benches and a fieldstone walking path. Northeast of the fountain is a circa-1940 stone colonnade. A circa-1980 mausoleum complex fronts Scotch Road in the southwest corner of the parcel, composed of three marble structures featuring colonnaded facades, centered on a stone gazebo. A circa-1969 garden crypt, featuring a reflecting pool surrounded by wrought iron fencing, is located to the south of the main entrance and is currently undergoing rehabilitation. The garden crypt and mausoleum complex are connected to the road network via rectangular dirt walking paths. The oldest grave in the cemetery is that of Franzisca Deutz, who died in 1870 but was reinterred in the subject cemetery along with several others whose decease pre-date its establishment. *See Continuation Sheet*

Setting:

The Ewing Cemetery and Crematory is located adjacent to the southeast of Scotch Road in the center of Ewing, New Jersey. The property is bounded by mature hardwood trees to the south, east, and north. Adjacent to the west, across Scotch Road, is the Ewing Covenant Presbyterian Church and its associated cemetery, which is a separate entity from the subject cemetery. Landscaping throughout the property includes stands of mature hardwood trees, decorative shrubbery, and planted flower beds. The surrounding area is characterized by primarily mid-twentieth-century residential and commercial development.

Roof Finish Materials: Asphalt Shingle

Exterior Finish Materials Stucco; Random Ashlar

Exterior Description:

The Ewing Crematorium is a two-and-one-half-story, frame building built in 1933 in the Tudor Revival style (see Plates 1–8). The building has a roughly square footprint formed of multiple, connected, side-gable volumes arranged around an enclosed, glass-roofed courtyard. The building incorporates a 1938 Gothic Revival stone chapel and houses an original caretaker's residence, crematorium, and columbarium, along with a 1960 flower corridor and solarium. A wood cupola pierces the roof ridge above the main entrance. A stone, exterior chimney rises above the northeast elevation; a stone, exterior chimney rises above the southwest elevation; an interior brick chimney rises above the northeast elevation; and a stucco, interior chimney rises near the center of the roof. *See Continuation Sheet*

Interior Description:

The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior that is visible from the public right-of-way and did not include interior access to the building.

Setting:

The building is sited facing Scotch Road at the western edge of the irregularly shaped cemetery parcel. The primary elevation faces northwest and is set back approximately 35 feet from the road. An asphalt parking lot is located adjacent to the northeast of the building. A concrete walkway leads to the main entrance on the primary elevation, with a similar walkway across the northeast elevation, rear (southeast) elevation, and leading to the memorial chapel entrance on the southwest elevation. Planted beds, shrubbery, and trees are located close to the building. The cemetery's burial ground is located adjacent to the east of the building. The surrounding area is characterized by primarily mid-twentieth-century residential and commercial development.

CONTINUATION SHEET

Historic Sites #:

Description, continued from Building/Element Attachment:

With the exception of the chapel, the building is primarily clad in stucco. The building houses an original caretaker's residence, administrative office, crematorium, and columbarium, along with a 1938 memorial chapel and a 1960 flower corridor and solarium. The main entrance leads to a central vestibule, flanked by the columbarium to the southwest and crematorium to the northeast. The garage is situated to the northeast of the building, adjoining the administration office to the southwest and the chapel at the southeast corner of the building. The flower corridor and solarium are centrally located. In addition to stained glass and leaded glass windows featured on the chapel, windows throughout primarily consist of original, wood, twelve-over-twelve and eight-over-eight double-hung sash units and casement units, along with wood paneled doors. The primary (northwest) elevation features a projecting front-gable volume to the southwest; its first story is clad in a brick veneer capped by wood trim with pendants. Sets of three narrow stained glass windows with transoms flank a central stone niche holding an urn on a pedestal. The main entrance stands at the central recessed volume, below a half-timbered second story with a facade gable. Concrete steps with a wrought iron handrail lead to an enclosed frame entryway featuring stained glass windows. Adjacent to the northeast, a two-story volume is framed by parapets with chimneys. An arched, fixed-pane window is framed by decorative brick. A fieldstone course extends along the base of the volume. A frame, shed-roofed sun porch enclosed by jalousie windows projects from the northeast elevation. A low hyphen with an entrance connects the front block to a four-bay garage with a steep gabled roof with parapets. The garage bays are separated by fieldstone piers. Three bays have rolling metal doors, and one bay is enclosed and contains a pedestrian entry and window. The southeast elevation of the garage is pierced at attic level by a circular louvered vent with a brick surround. Below the attic vent are two blind fieldstone arches flanked by fieldstone piers simulating buttresses. The central volume of the southeast elevation has a projecting, enclosed entry flanked by strips of casement windows and a boarded-up shed-roofed dormer. The building's southeast volume houses the Gothic Revival memorial chapel which is clad in fieldstone veneer and features a square tower with a slate-clad spire rising above it. Corner piers with pyramidal caps and gabled parapets surround the base of the spire above paired Gothic window openings infilled with louvers and framed by terra cotta. A stained glass window at the base of the tower is also surrounded by terra cotta. The main body of the chapel has a parapeted front-gable roofline with terra cotta coping and features large stained glass window with terra cotta tracery. On the southwest elevation of the chapel there is a gabled entryway supported by wood posts. Paired stained glass windows with terra cotta surrounds pierce the elevation. A frame octagonal sun porch extends from the southwest elevation, adjacent to the chapel. The inner courtyard of the building features two volumes capped by glass roofs framed with metal, including a side-gable roof for the flower corridor and a pyramidal roof for the solarium.

Description, continued from Landscape Attachment:

The gravestones in the burial ground of the Ewing Cemetery and Crematory range from the late nineteenth century to the present. Stones dating to the late nineteenth and early twentieth centuries are mostly upright stones and include examples of obelisks, pedestal tombs, crosses, and stylized grave markers, indicating the Romantic nature of these graves. Gravestones dating from the mid-twentieth century to the present are typically mass-produced upright stone. Also present are flat, flush with the ground markers, as well as slanted markers from this era. Marble, sandstone, and granite marker construction is featured throughout the cemetery.

History:

The Ewing Cemetery and Crematory is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. The current boundary between Ewing Township and the City of Trenton was officially set in 1876 (Ewing Township Planning Board [ETPB] 2006). In 1890, local doctor John S. Hough's 18-year-old daughter died and was buried at the Ewing Church. Shortly thereafter, Dr. Hough decided it would be both honorable and profitable to open his own cemetery. He purchased 30 acres of farmland across Scotch Road from the Ewing Church, and by 1893, the Ewing Cemetery Association was incorporated (Ewing Cemetery Association 2024a). An 1895 newspaper advertisement for the cemetery targeted Trenton residents, noting that 10 × 10-foot lots were being sold at one-third the price of city cemeteries; large monuments were soon erected, and macadamized roads surrounded the grounds (TET, 15 August 1895:3). Following the sudden death of Dr. Hough in 1890, the subject cemetery fell into a state of

CONTINUATION SHEET

Historic Sites #:

History, continued:

disrepair before being revived by his son Arthur S. Hough Sr. In 1924, the first building on the property, a bungalow, was constructed, although it is uncertain where this building stood (Ewing Cemetery Association 2024b). A 1931 aerial image depicts the subject cemetery's central and northeast roads, along with a stand of trees delineating the northeast border (NETR 1931). During the early twentieth century, residents of Trenton began moving to the rural lands of Ewing Township. As a result, the agricultural fields and undeveloped areas close to Trenton began to transform into residential developments (ETPB 2006).

Although in practice for millennia, modern cremation traces its roots to 1870s Europe and health officials concerned over unsanitary burial practices. The first North American crematory was built in 1876 in Washington, Pennsylvania. The practice grew in the early twentieth century in response to Protestant burial practice reform, in addition to health concerns. In 1913, the Cremation Association of America was established as the official trade association for the crematory industry. That year, over 10,000 cremations took place in the 52 crematories across North America (Cremation Association of North America 2024). In 1933, the Ewing Crematorium building, including a memorial chapel, columbarium, and caretaker's residence, was built. Two retorts were originally utilized in the cremation room, and Arthur S. Hough Sr. resided in the second-story residence upon its construction. The building was designed by William G. Kafes, a Trenton architect (TET, 25 November 1933:7). According to the Ewing Cemetery Association, at that time the organization helped define the state regulations over cremation (Ewing Cemetery Association 2024b). This likely refers to guidance provided to the New Jersey State Association of Cemetery Officials, organized in Trenton in 1932. Now known as the New Jersey Cemetery Association, the organization continues to promote best practices for cemeteries throughout the state (New Jersey Cemetery Association 2024).

The Ewing Cemetery and Crematory was founded at a time of general burial reform in America (Snyder 1988:241–242). Changing views regarding religion, domestic life, and the role of mourning and memory emerged during the early nineteenth century (Ames 1981; Pike and Armstrong 1980; Snyder 1988:241). Increasingly, those who died were seen not as deceased, but as departed and sleeping eternally, assured of salvation in the afterlife (Snyder 1988:242). The relationship between the living and the dead changed at the same time, with a greater emphasis on grief and remembrance. New rituals developed to accommodate the journey from deathbed to final resting place. Rural cemeteries were established in growing numbers as places of dignified repose for the dead and contemplative leisure for the living (Snyder 1988:255). They were in stark contrast to the older, urban churchyards, which had grown overcrowded, disorderly, and unkempt. Parallel concerns over sanitation and public health also helped fuel the shift toward new burial practices. New cemeteries favored individually owned plots arranged in neatly ordered grids amidst wide pathways and tidy stone or iron fence enclosures. Each plot could hold the owner's immediate family, marked by a central monument. Such an arrangement mirrored Victorian ideals of the domestic sphere, in which the burial plot assumed the role of the family dwelling (Snyder 1988:263).

The symbolism found on the late nineteenth- to early twentieth-century markers in the Ewing Cemetery and Crematory mirrors that found in other cemeteries. It characterized death as a state of sleep or rest or contained allegorical imagery of Christian faith or of life cut short. As tastes changed to more naturalistic forms, markers took on rustic qualities with rough stone finishes. Plantings soon augmented the landscape, so that the dearly departed were laid to rest in proper, carefully landscaped surroundings (McGuire 1988:446–456). As reflected in the subject cemetery, the mid-nineteenth century saw the introduction of the lawn-park cemetery, which favored an orderly, maintained landscape in opposition to the more natural, rural cemetery that had previously been popular. Larger headstones and family plots, the most affluent of which featured mausoleums, became popular as well. After World War II, gravestones became smaller, spouse plots largely replaced family groupings, and there was a greater uniformity of headstone design. The late twentieth century saw the introduction of mass-produced flush and slant gravestones with etched symbols of personal interests (McGuire 1988:446–456).

CONTINUATION SHEET

Historic Sites #:

History, continued:

In 1938, the extant chapel of the Ewing Crematorium was constructed, designed by Trenton architect John Harman Harvey (TET, 3 April 1938:30). Aerial imagery from 1940 shows the extant footprint of the Ewing Crematorium, as well as trees planted along the central drive, a southwest exit road had been built, and the stone colonnade constructed (NETR 1940). Newspaper advertisements published by the Ewing Cemetery Association in the 1940s sought to promote cremation as a safe, affordable, and popular approach to modern burials (Hopewell Herald, 23 August 1944:3, 20 September 1944:5). By 1947, the cemetery's central road had been expanded to the southeast of the central circle, connecting to the northeast road to form a rectangular circulation route (NETR 1947). The roadway network was completed by 1957, including the triangular pattern north of the southwest border road (NETR 1957). The administration building, flower corridor, and solarium were added within the crematorium building in 1960 (Ewing Cemetery Association 2024b; Figures 1–4). The central fountain was built in 1962, infilling the central grass circle. The original southwest exit road was removed in the mid-1960s, creating the present circulation route. Also at that time, the garden crypts and a reflecting pool were added in the southwest corner of the cemetery (NETR 1963, 1969). Interior alterations to the crematorium building circa 1980 included an expansion of the columbarium and the crematorium room (Ewing Cemetery Association 2024b). Circa 1980, the mausoleum complex was constructed (NETR 1979, 1984). Between 2022 and the present, the reflecting pool adjacent to the east of the garden crypt was removed (NETR 2022). Among the notable people cremated at the Ewing Crematorium are Dr. Albert Einstein, his wife Elsa, and stepdaughter Margot, none of whom are interred at the subject cemetery (Ewing Cemetery Association 2024c).

Significance:

Used consistently for 131 years, the Ewing Cemetery and Crematory's artistic, architectural, and landscape features derive from evolving tastes and attitudes towards burial practices, funerary art, and general cemetery design. The cemetery reflects changing attitudes regarding religion and burial practices and exemplifies the lawn-park cemetery, with a variety of family plots, couple plots, and headstone motifs which mirror national trends. Most of the monuments, while representative of known styles and forms, lack artistic distinction and are undistinguished, plain, and/or mass-produced products used throughout the country. The one extant building, the Ewing Crematorium, represents the Tudor Revival Style through half-timbering, massive chimneys, tall, narrow windows, and prominent front-facing gables, as well as Gothic Revival influence through the fieldstone, pointed-arch windows, and tower seen on the memorial chapel. Dr. Albert Einstein, his wife Elsa, and stepdaughter Margot were cremated at the Ewing Crematorium but not interred at the subject cemetery. This crematorium exemplifies the growth of crematory practices in the early twentieth century throughout the country.

Justification of Eligibility/Ineligibility:

The Ewing Cemetery and Crematory is not recommended eligible for listing in the National Register of Historic Places (NRHP) in accordance with *National Register Bulletin 41: Guidelines for Evaluating and Registering Cemeteries and Burial Places*. Considering Criterion A, the property is not particularly representative of the community's history through association with a specific event or broad pattern. Although established relatively early in the history of crematoriums in the country, the subject property does not represent the late nineteenth-century foundational era of crematoriums. Furthermore, a review of NRHP-listed cemeteries which include crematoriums, such as the Gardner Earl Memorial Chapel and Crematorium, shows that the multifunctional usage of a crematorium building, along with an associated cemetery as seen in the subject property, is a relatively common feature of late nineteenth- to early twentieth-century crematories and not a unique design. Furthermore, these turn of the century crematoriums are frequently signified through grand architectural expressions, which the Ewing Crematorium building lacks (Shaver 2003). Despite being the site of cremation for Albert Einstein and family, the property does not meet the level of historical importance required under Criterion B. Considering Criterion C, the cemetery is a common example of the lawn-park style, popular from the late nineteenth to early twentieth century. Furthermore, the cemetery features markers typically found throughout the state and country, and no works of a master are present. This 1933 crematorium and its 1938 chapel addition were designed by local architects who worked on commercial buildings throughout the Trenton area but were not responsible for any prominent designs. The cemetery largely retains its integrity of location, setting, materials, and workmanship; however,

CONTINUATION SHEET

Historic Sites #:

History, continued:
the construction of the large circa-1980 mausoleum complex and the addition of upright granite headstones from the late twentieth century to the present disrupts the feeling of the cemetery's early twentieth-century character.

Municipality(s): Ewing Township **Block(s):** 368

Local Place Name(s): West Trenton **Lot(s):** 6

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

The Glen Roc Shopping Center at 172–252 Scotch Road is a shopping plaza comprising two multi-tenant strip commercial buildings, a freestanding bank, and a storage building, all of which were constructed circa 1972–1973 (Plates 1–22). The two multi-tenant commercial buildings form an L-shaped footprint and are separated by a narrow gap. Each contains retail units. The southeast building was constructed in 1972, and the northwest building was added in 1973. The circa-1973 drive-thru bank building is located between the shopping plaza and the road and is surrounded by a large asphalt-paved parking lot. Entrances and exits connect the parking lot to Scotch Road to the west and Upper Ferry Road to the south. Landscaped medians border the frontage along both roads. Small, elliptical landscaped islands define the ends of each of the six rows of parking spaces between the shopping plaza and Scotch Road. The circa-1973 storage building is located in the north corner of the property.

Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Brick, Running Bond; Stucco; Concrete Block, Modern

Exterior Description:
The Glen Roc Shopping Center Southeast Building is a multi-tenant commercial building built in 1972 (see Plates 1–8). The one-story, concrete block building has an elongated rectangular footprint fronting an asphalt-paved parking lot. This building is composed of 12 retail storefronts. The side-gable roof is sheathed in asphalt shingles, with a deep overhang above the primary (southwest) elevation. The primary elevation is characterized by a series of storefronts with nine-light and twelve-light fixed-pane wood windows. Roughly half of the entrances feature wood pediments over paired doorways that lead to separate retail tenant spaces within. The doors are primarily replacement vinyl units. The seven tenant spaces at the center of the building are covered in stucco, while the outer tenant spaces have brick-veneered facades. A three-bay-wide restaurant caps the southeast end of the building. The primary elevation of this section of the building is finished with stucco, while the southeast elevation is exposed brick. The main entry into the restaurant consists of glazed metal doors recessed within a projecting entry vestibule. Structural concrete block is exposed on the rear (northeast) elevation. The northwest elevation is clad in stucco and located directly adjacent to the 1973 northwest building. The foundation is not visible.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior and did not include interior access to the building.

Roof Finish Materials:	Asphalt Shingle		
Exterior Finish Materials	Concrete; Stucco		

Exterior Description:
The Glen Roc Shopping Center Northwest Building is a commercial shopping center built in 1973 (see Plates 10–15, 18, 19). The one-story, concrete block building has an L-shaped footprint, composed of a main block and a northwest ell that front an asphalt-paved parking lot. This building is composed of 12 storefronts. The main block's side-gable roof is stepped and sheathed in asphalt shingles, with a deeply overhanging eave on the primary (southwest) elevation. The primary elevation is clad in ribbed precast concrete panels and features a series of storefronts with nine-light and twelve-light fixed-pane wood windows. Doors are primarily replacement vinyl units set within wood trim. A central section that houses two retail units is deeply recessed, with a wide concrete sidewalk that extends to the two doors, which are located in the outer ends of the recessed section. Two 12-light storefront windows are widely spaced at the middle of the recessed portion of the building. Vinyl siding covers the gable ends of the side elevations of the flanking sections of the building. The southeast elevation is covered in stucco and located directly adjacent to the 1972 southeast building of the shopping center. The foundation is not visible.

The ell is a one-and-one-half-story side-gable volume forming a rectangular footprint constructed circa 2008. Two stucco-clad gable dormers pierce the southeast slope of the roof. The ell features replacement vinyl window units throughout. The southeast and southwest elevations are clad in concrete block below a stucco finish, with a frame colonnade extending over the entryway. Glazed metal doors provide entry to four commercial units. A single bay protrudes from the rear of the southwest elevation. The northeast elevation features stucco cladding in the gable and exposed concrete block below, with access provided by two flush metal doors and a rolling garage door. The rear (northwest) elevation features exposed concrete block and four flush metal doors. The foundation is not visible.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior and did not include interior access to the building.

Setting:

Builder: Unknown **Remaining Historic Fabric:** Medium
Style: None
Form: Other **Stories:** 2
Type: N/A **Bays:** 3
Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Stucco

Exterior Description:
The Glen Roc Shopping Center Storage Building is an ancillary building to the commercial shopping center, built circa 1973 (see Plates 16–17). The two-story concrete block building has a rectangular footprint and an asphalt-shingled, side-gable roof. The building is covered in textured stucco with vinyl siding in the gable ends of the southeast and northwest side elevations. A roll-up metal garage door capped by a wood lintel and a flush metal pedestrian door provide access to the first story on the primary (southwest) elevation. The second story of the primary elevation features three two-light sliding aluminum windows with simple concrete sills in the second story. An enclosed exterior staircase that rises to the second story on the northwest elevation is accessed by an aluminum paneled door on the first story of the primary elevation. The southeast elevation lacks any window or door openings. The foundation is not visible, and the rear (northeast) elevation is not visible from the public right-of-way.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior and did not include interior access to the building.

Setting:
The Glen Roc Shopping Center Storage Building is located in the northeast quadrant of the intersection of Scotch Road and Upper Ferry Road in Ewing Township, Mercer County, New Jersey. The subject building faces southwest and is situated approximately 260 feet from Scotch Road. The subject building is located in the north corner of the irregularly shaped parcel (Block 368, Lot 6) and approximately 30 feet from the northwest building of the shopping center. An asphalt-paved service road fronts the subject building. The area surrounding the subject property primarily consists of mid- to late twentieth-century residential and commercial buildings.

Roof Finish Materials:	Asphalt Shingle		
Exterior Finish Materials	Stucco		

Exterior Description:
The Glen Roc Shopping Center Bank Building is an ancillary building to the commercial shopping center, built circa 1973 (see Plates 20–22). The one-and-one-half-story building has a nearly square footprint. It faces southwest, toward Scotch Road, and has an asphalt-shingled, side-gable roof with a gabled dormer projecting from the front slope of the roof. The dormer has three double-hung, six-over-six replacement windows grouped together in a shared surround. The roof has a deep overhang over the primary (southwest) elevation, The main entrance is situated on the southwest elevation close to the south corner of the building. The doorway is wide and filled with a single-leaf fully glazed commercial door with a tall, one-light transom and wide, one-light sidelight, all of which are contained within a metal surround. Three tall, rectangular, one-light windows are closely spaced at the center of the primary elevation. A side-gable drive-thru canopy extends from the northwest elevation, stylistically matching the main block. Wood, square columns support the canopy. Windows and doors on the southeast, northeast, and northwest elevations are all replacement metal units. The foundation is not visible.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior and did not include interior access to the building.

Setting:
The Glen Roc Shopping Center Bank Building is located in the northeast quadrant of the intersection of Scotch Road and Upper Ferry Road in Ewing Township, Mercer County, New Jersey. The subject building faces southwest and is situated approximately 100 feet from Scotch Road. The subject building is located in the center of the irregularly shaped parcel (Block 368, Lot 6) surrounded by the asphalt-paved parking lot. The area surrounding the subject property primarily consists of mid- to late twentieth-century residential and commercial buildings.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
The Glen Roc Shopping Center is an exemplifies outdoor shopping centers constructed in the 1960s and 1970s. Coinciding with the rise of the automobile and the post-World War II building boom, these shopping centers often featured elements seen in the subject buildings, such as large fixed-pane windows, canopies, asymmetrical storefronts, and brick façades. Since its construction, most of the original doors have been replaced, and the complex has otherwise received alterations consistent with stylistic preferences for commercial properties of this kind.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
The Glen Roc Shopping Center is not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with prominent individuals or patterns of history. Architecturally, the building retains a high degree of integrity of location, setting, feeling, and association; however, it is a common and unremarkable example of its type, not highlighted by any characteristically mid-century design elements or materials or the work of a master. Furthermore, the replacement of exterior windows, doors, and siding has diminished its integrity of design, workmanship, and materials. For these reasons, the Glen Roc Shopping Center is recommended not eligible for listing in the NRHP under Criteria A, B, or C.

CONTINUATION SHEET

Historic Sites #:

Setting, continued from Building/Element Attachment: Glen Roc Shopping Center Southeast Building:
The Glen Roc Shopping Center Southeast Building is located in the northeast quadrant of the intersection of Scotch Road and Upper Ferry Road in Ewing Township, Mercer County, New Jersey. The subject building faces southwest and is situated approximately 200 feet from Scotch Road. The southeast building is located at the southeastern edge of the irregularly shaped parcel (Block 368, Lot 6) and approximately 5 feet from the shopping center's northwest building. The area surrounding the subject property primarily consists of mid- to late twentieth-century residential and commercial buildings.

Setting, continued from Building/Element Attachment: Glen Roc Shopping Center Northwest Building:
The Glen Roc Shopping Center Northwest Building is located in the northeast quadrant of the intersection of Scotch Road and Upper Ferry Road in Ewing Township, Mercer County, New Jersey. It faces southwest and is situated approximately 200 feet from Scotch Road. The subject building is located to the northeast of the irregularly shaped parcel (Block 368, Lot 6) and approximately 5 feet from the southeast building of the shopping center. The area surrounding the subject property primarily consists of mid- to late twentieth-century residential and commercial buildings.

History:
The Glen Roc Shopping Center is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Aerial imagery indicates that this site was undeveloped until the mid-twentieth century. The subject property was the site of the Glen Roc Swimming Club, which existed for roughly 10 years between the late 1950s and late 1960s (Nationwide Environmental Title Research [NETR] 1958, 1969; TET, 7 July 1972:13). The swimming club consisted of a large, rectangular, in-ground swimming pool and a clubhouse with a roughly square footprint in the location of the present bank building. The Glen Roc Shopping Center, constructed circa 1972–1973, was built at a time of commercial and industrial growth throughout Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (TET, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more development in the West Trenton area. A rising population throughout the second half of the twentieth century required further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; NETR 1931, 1947, 1963, 1970).

Designed by Trenton architect John S. Rhoads, the southeast plaza building of the Glen Roc Shopping Center was constructed in 1972 by the Princeton-based developer Parkside Leasing Service. Although the extant Glen Roc Shopping Center Bank was built upon the site of the clubhouse of the former Glen Roc Swimming Club, displaying a similar footprint, the former building appears to have been demolished and not renovated according to aerial imagery (NETR 1970, 1971, 1979). The developer planned to build the complex over three phases of construction, with the ultimate goal of creating 22 commercial units (TET, 7 July 1972:13). The nationwide rise of the automobile and growth of suburban landscapes in the mid-twentieth century brought on the growth of roadside commercial centers. These buildings often utilized cutting-edge modular building materials, often in sleek geometric forms. Large, multi-light fixed-pane storefront windows provided a view into each retail space, and the sheltered walkway, which was inset below the overhanging roof, protected shoppers. Asymmetrical storefronts with large fixed-pane windows in front of brick, concrete, or curtain wall facades were common (Philadelphia City Planning Commission 2014). The northwest plaza building was added in 1973 (TET, 23 January 1973:60). The storage and drive-thru buildings were likely constructed at that time, with the present footprint of the entire shopping center visible on aerial imagery between 1971 and 1979 (TET, 7 July 1972:13; NETR 1971, 1979). The Glen Roc Shopping Center currently houses 24 commercial units,

CONTINUATION SHEET

History, continued:

suggesting a reorganization of the various units, or a design change during the construction process. Various tenants have occupied the storefronts of the subject shopping center over the years. Based on stylistic evidence, at some point in the late twentieth century or early twenty-first century, sections of exterior siding and select windows and doors were replaced.

Description:

14 Corey Drive is a two-story, frame-constructed, vernacular dwelling building built circa 1963 (Plates 1–3). The dwelling, likely of split-level form, has a rectangular footprint and measures four bays wide by two bays deep, with a raised first story. A side-gable roof sheathed in asphalt shingles is pierced by an exterior, brick chimney rising above the northeast elevation. The exterior is clad in vinyl siding and vinyl window units are utilized throughout. Four square, wood, full-height posts support an eave overhanging the primary (southeast) elevation. The second story features a slight overhang on the primary elevation, apart from an off-center, recessed main entrance. *See Building/Element Attachment*

Common Name: 14 Corey Drive
Historic Name: 14 Corey Drive
Present Use: Residential Activity, Permanent (single-family)
Historic Use: Residential Activity, Permanent (single-family)
Construction Date: 1963 **Source:** Trenton Evening Times (TET), 7 July 1963:49
Alteration Date(s): Late twentieth to early twenty-first century **Source:** Stylistic evidence
Designer: Unknown **Physical Condition:** Good
Builder: Mark Construction Company **Remaining Historic Fabric:** Medium
Style: None
Form: Split Level **Stories:** 2
Type: N/A **Bays:** 4
Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Vinyl Siding

Exterior Description, continued from Base Survey Form:
The main entrance is accessed by a set of concrete steps with a metal handrail leading to glazed metal door flanked by sidelights. Windows on the primary elevation are flanked by inoperable vinyl shutters. Second-story window units include six-over-six sashes, while the first story is pierced by two-pane sliding units. The southwest elevation features symmetrical fenestration of typical windows and a rolling metal garage door. The northeast elevation lacks any window or door openings. The rear (northwest) elevation is not visible from the public right of way. The dwelling sits atop a parged foundation.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior and did not include interior access to the building.

Setting:
The dwelling at 14 Corey Drive is located along the northwest side of Corey Drive in Ewing Township, Mercer County, New Jersey. The subject dwelling is situated on an irregularly shaped parcel (Block 541, Lot 9), facing southeast, approximately 70 feet from Corey Drive. An asphalt driveway leads from the roadway to the dwelling's southwest elevation, and a concrete walkway leads to the main entrance. A concrete sidewalk runs across the southeast border of the property. Mature trees and shrubbery are located in proximity to the dwelling. The area surrounding the subject property primarily consists of mid- to late twentieth-century residential and commercial buildings.

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
The dwelling at 14 Corey Drive is an example of a vernacular dwelling built circa 1963, likely split level in form. The property is located within the mid-twentieth-century housing development of Village on the Green, constructed circa 1964–1969. The construction of this dwelling coincides with the rise of the automobile and the post-World War II building boom in Ewing Township and throughout the country.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
The dwelling at 14 Corey Drive is not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with prominent individuals or patterns of history. Although part of the Village on the Green, the construction of the subject dwelling predates this planned housing development and does not strongly convey the significance of this common suburban planning trend. Architecturally, the building retains a high degree of integrity of location, setting, feeling, and association; however, it is a common and unremarkable example of its type, not highlighted by any characteristically mid-century design elements or materials or the work of a master. Furthermore, the replacement of exterior windows, doors, and siding has diminished its integrity of design, workmanship, and materials. For these reasons, 14 Corey Drive is recommended not eligible for listing in the NRHP under Criteria A, B, or C.

CONTINUATION SHEET

Historic Sites #:

History:

The dwelling at 14 Corey Drive is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (TET, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; Nationwide Environmental Title Research [NETR] 1931, 1947, 1963, 1970).

Aerial imagery from 1958 shows the subject property utilized agriculturally (NETR 1958). By 1962, building permits were being approved for development along Rockleigh Drive, adjacent to the south of Charles Ewing Boulevard, roughly 0.5-miles northeast of the subject property (TET, 17 June 1962:38). In July 1963, a building permit for 14 Corey Drive was approved, to be owned and built by the Mark Construction Company, a Trenton residential building company that does not appear to have constructed other such planned communities (TET, 7 July 1963:49). The subject property was likely constructed shortly after the building permit was approved. Aerial imagery from 1963 shows Corey Drive under construction, with dwellings built to the southeast of the roadway. Additional residential development adjacent to the south of Upper Ferry Road also occurred at that time, as part of the Hickory Hill Estates housing development (NETR 1963). In December 1963, the Mark Construction Company received approval for the construction of the Village on the Green housing development, on 30 acres previously occupied by the "Arnold Farm," to the west of Pennington Road between Upper Ferry Road and Charles Ewing Boulevard (TET, 13 February 1963:12). The area already featured several houses, including 14 Corey Drive, with plans for up to 48 additional residences built on 0.5-acre lots, to be sold for $20,000 to $25,000. In addition to roadways, drainage, utilities, and sidewalk construction, a central park would be built, now known as Village on the Green (TET, 13 February 1963:12). Aerial imagery from 1969 shows the extant footprint of 14 Corey Drive as well as the development of the Village on the Green being nearly complete, with a section to the northeast of intersection of Pennington Road and Charles Ewing Boulevard still under construction (NETR 1969). According to stylistic evidence, 14 Corey Drive has undergone window, door, and siding replacements since its construction.

County(s): Mercer **Zip Code:** 08628

Municipality(s): Ewing Township **Block(s):** 540

Local Place Name(s): West Trenton **Lot(s):** 13

Ownership: Private **USGS Quad(s):** Pennington, NJ-PA

Description:

7 Corey Drive is a two-story, frame-constructed, vernacular dwelling building built circa 1963 (Plates 1–2). The dwelling has a rectangular footprint, including a two-story main block with an attached one-story garage to the northeast. The main block measures three bays wide by two bays deep and the garage measures two bays wide by two bays deep. A side-gable roof sheathed in asphalt shingles is pierced by an exterior, brick chimney rising above the northeast elevation. The exterior is clad in vinyl siding and vinyl window units are utilized throughout. The second story features a slight overhang on the main block's primary (northwest) elevation. *See Building/Element Attachment*

Description:

143 Upper Ferry Road is a two-story, frame-constructed, vernacular dwelling building built circa 1959 (Plates 1–4). The dwelling is composed of three volumes in a split-level form, with a raised first story. The central block measures three bays wide by two bays deep, the southwest block, a shorter two-stories in height, measures three bays wide by two bays deep, and the one-story northeast block measures one bay wide by two bays deep. The northeast block is a circa-1969 addition and extends beyond the rear elevation of the original house to create an L-shaped footprint. A side-gable roof sheathed in asphalt shingles is pierced by an exterior, brick chimney rising above the central block's northeast elevation and an interior, brick chimney rising from the northeast block. The exterior is clad in vinyl siding and vinyl window units are utilized throughout the second story, with primarily aluminum units on the first story. *See Building/Element Attachment*

Roof Finish Materials: Asphalt Shingle
Exterior Finish Materials Vinyl Siding

Exterior Description, continued from Base Survey Form:
The second story slightly overhangs the first story on the main block's primary (northwest) elevation on the central and southwest blocks, featuring a central pent roof. The central and southwest blocks primarily are clad in a fieldstone veneer across the first story. The centrally located main entrance includes a concrete step with a wood handrail leading to a vinyl paneled door. Second-story windows on the primary elevation feature inoperable vinyl shutters. The northeast block is pierced by a central tripartite casement window on the primary elevation, matched by a four-light window on the northeast elevation. The southwest elevation features asymmetrical fenestration of typical windows and a glazed wood door. The rear (southeast) elevation is not visible from the public right-of-way; however, aerial imagery shows the northeast block wrapping around the east corner of the dwelling to form an L-shaped footprint. The dwelling sits atop a parged foundation.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior and did not include interior access to the building.

Setting:
See Continuation Sheet

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
The dwelling at 143 Upper Ferry Road is an example of a vernacular dwelling built circa 1959 in a split-level form. The property is located within the mid-twentieth-century housing development of Hickory Hill Estates, constructed between 1958 and 1962. The subject property was built to serve a mixed-use purpose as both a single-family residence and dentist's office. The construction of this dwelling coincides with the rise of the automobile and the post-World War II building boom in Ewing Township and throughout the country.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
The dwelling at 143 Upper Ferry Road is not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with prominent individuals or patterns of history. Part of the Hickory Hill Estates, this housing development is typical of the mid-twentieth-century's suburban planning trend, and does not rise to the level of significance required for eligibility under Criterion A. Architecturally, the building retains a high degree of integrity of location, setting, feeling, and association; however, it is a common and unremarkable example of its type, not highlighted by any characteristically mid-century design elements or materials or the work of a master. Furthermore, the replacement of exterior windows, doors, and siding has diminished its integrity of design, workmanship, and materials. For these reasons, 143 Upper Ferry Road is recommended not eligible for listing in the NRHP under Criteria A, B, or C.

CONTINUATION SHEET

Historic Sites #:

Setting:
The dwelling at 143 Upper Ferry Road is located adjacent to the southeast corner of the intersection of Upper Ferry Road and Lower Ferry Road in Ewing Township, Mercer County, New Jersey. The subject dwelling is situated on an irregularly shaped parcel (Block 229.01, Lot 6), facing northwest, approximately 60 feet from Upper Ferry Road. A concrete driveway and parking lot lead from Lower Ferry Road to the southwest elevation of the dwelling. A concrete path leads from the parking lot to the main entrance and a concrete sidewalk which borders the property to the southwest and northwest. Mature trees and shrubbery are located in proximity to the dwelling. The area surrounding the subject property primarily consists of mid- to late twentieth-century residential and commercial buildings.

History:
The dwelling at 143 Upper Ferry Road is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (TET, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; Nationwide Environmental Title Research [NETR] 1931, 1947, 1963, 1970).

Aerial imagery from 1958 shows the subject property utilized agriculturally, with roadway construction beginning in the surrounding area (NETR 1958). In 1959, the subject property at 143 Upper Ferry Road was constructed, part of the first phase of the Hickory Hill Estates housing development. That year, Dr. John C. Long moved his dental practice to the property, where his family also resided. The dwelling is described as a four-bedroom split level with a stone fireplace and unfinished basement, along with alterations for use as a medical practice including offices, air conditioning, and waiting rooms (TET, 5 April 1959:39, 14 June 1959:37). The first phase of construction for the Hickory Hill Estates included 70 properties adjacent to the east of the intersection of Upper Ferry Road and Lower Ferry Road. The project was managed by the Hickory Hill Estates, Inc. development corporation and properties were sold by Mercer County Realty. The construction included 60-foot-wide roadways with asphalt paving and concrete curbs, sewers, 0.5-acre landscaped lots, and individualized home design based on split level and one-story ranch forms (TET, 14 June 1959:37, July 24 1960:32). In 1960, a 55-acre tract was added to the development through the purchase of the Goodrich Farm, adjacent to the west of Pennington Road. This acquisition formed the final boundaries of the development, extending from Upper Ferry Road to Hillside Avenue, between Lower Ferry Road and Pennington Road. Dwellings in this section ranged in price from $19,990 to $24,990, with models including a "Bi-Level Estate," "Split-Level Estate," "Four Bedroom Colonial Estate," and a "Ranch Estate," Construction of development in this area matched the roadways, lot sizes, and other features of the first construction phase (TET, 30 October 1960:37; Figure 1). By 1962, the development's construction was complete and the last of the 152 dwellings of the Hickory Hill Estates had been sold (TET, 24 June 1962:44). Aerial imagery appears to show the addition of the northeast block to 143 Upper Ferry Road between 1963 and 1969 (NETR 1963, 1969). In the 1980s, the subject property at 143 Upper Ferry Road was utilized as a dental office by Allan G. Weisberg (TET, 26 May 1985:33). According to stylistic evidence, 143 Upper Ferry Road has undergone window, door, and siding replacements since its construction, and currently functions solely as a residence.

CONTINUATION SHEET

Historic Sites #:

History:

The dwelling at 131 Upper Ferry Road is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (TET, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; Nationwide Environmental Title Research [NETR] 1931, 1947, 1963, 1970).

Aerial imagery from 1958 shows the subject property utilized agriculturally, with roadway construction beginning in the surrounding area (NETR 1958). Based on the construction of surrounding properties, the subject property at 131 Upper Ferry Road was constructed circa 1959, part of the first phase of the Hickory Hill Estates housing development (TET, 14 June 1959:37). The first phase of construction for the Hickory Hill Estates included 70 properties adjacent to the east of the intersection of Upper Ferry Road and Lower Ferry Road. The project was managed by the Hickory Hill Estates, Inc. development corporation and properties sold by Mercer County Realty. The construction included 60-foot-wide roadways with asphalt paving and concrete curbs, sewers, 0.5-acre landscaped lots, and individualized home design based on split level and one-story ranch forms (TET, 14 June 1959:37, July 24 1960:32). Thus, the subject property is an example of a split-level dwelling commonly found throughout the Hickory Hill Estates. In 1960, a 55-acre tract was added to the development through the purchase of the Goodrich Farm, adjacent to the west of Pennington Road. This acquisition formed the final boundaries of the development, extending from Upper Ferry Road to Hillside Avenue, between Lower Ferry Road and Pennington Road. Dwellings in this section ranged in price from $19,990 to $24,990, with models including a "Bi-Level Estate," "Split-Level Estate," "Four Bedroom Colonial Estate," and a "Ranch Estate," Construction of development in this area matched the roadways, lot sizes, and other features of the first construction phase (TET, 30 October 1960:37; Figure 1). By 1962, the development's construction was complete and the last of the 152 dwellings of the Hickory Hill Estates had been sold (TET, 24 June 1962:44). Aerial imagery from 1963 shows the extant footprint of the dwelling at 131 Upper Ferry Road (NETR 1963). Newspaper articles indicate that by 1968 Edward and Mae Keelan resided at the property. Mr. Keelan was a World War II Navy veteran and chemist at Thiokol Chemical Corporation in Trenton (TET, 3 May 1985:60). According to stylistic evidence, 131 Upper Ferry Road has undergone window and door replacements since its construction.

The dwelling at 1337 Lower Ferry Road is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (TET, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; NETR 1931, 1947, 1963, 1970). In 1955, the school now known as Fisher Middle School was constructed adjacent to the west of the subject property (TET, 27 October 1955:15).

In 1959, Micheal Wallo received approval for a building permit to construct an addition to the subject dwelling, including a bedroom and bathroom for $4,500 (TET, 19 April 1959:44). Wallo, a machinist at the Ewing-based Nelson Machine and Manufacturing Co., resided at the subject dwelling with his wife Elizabeth (TET, 30 November 1985:82). Also in 1959, construction began on the Hickory Hill Estates housing development, adjacent to the east of Lower Ferry Road (TET, 14 June 1959:37). Completed by 1962, this development transformed the surrounding area from a primarily agricultural expanse into a suburban neighborhood (TET, 24 June 1962:44). According to stylistic evidence, 1337 Lower Ferry Road has undergone window and door replacements since its construction. Between 2021 and the present, asbestos shingle siding on the subject dwelling was replaced with the extant vinyl (Google Imagery 2021).

Description:

The Fisher Middle School is an educational campus composed of a 1955 school building with 1962, circa-1979, and circa-2002 additions, along with a 1962 administration building with a 2013 addition. The brick-constructed school building ranges from one to two stories in height, has a roughly-L-shaped footprint composed of multiple rectangular volumes, and displays Modernistic-style influence (Plates 1–19). The original, main block is composed of a two-story northwest volume, matched in height by the main entrance vestibule fronting the primary (northeast) elevation and the southeast gymnasium, while the remainder of the main block is one story in height. *See Building/Element Attachment*

Roof Finish Materials:	Rolled Asphalt; Standing Seam Metal		
Exterior Finish Materials	Brick, Running Bond; Vinyl Siding		

Exterior Description, continued from Base Survey Form:

The flat roof is sheathed in rolled asphalt. Windows throughout consist of fixed-pane and sliding glass units set within multi-light metal frames, infilled with a composite material. Glazed metal doors are utilized throughout. A central section of the rear (southwest) elevation is distinguished by covered entryways with concrete stoops and a loading bay with a rolling metal garage door. The 1962 southeast addition matches the original volume stylistically, including a tan brick exterior, while the 2002 rear (south) addition is distinguished by red brick. The 2002 addition includes volumes to the southeast and southwest of the original block, forming three interior courtyards (see Plates 6, 7, 12, and 13). Windows throughout the addition consist of coupled metal units, and doors are of glazed metal. Entrances on the addition are primarily enclosed in vestibules capped by gabled parapets and supported by simple brick posts. The southeast volume of this addition includes brick piers and glass block windows. The circa-2002 main entrance, enclosed in a typical vestibule added to the primary elevation, includes a brick colonnade capped by a standing-seam metal roof. The circa-1979 northwest addition features a side-gable roof sheathed in asphalt shingles, vinyl cladding above a brick veneer and coupled metal windows (see plates 16 and 17).

ELIGIBILITY WORKSHEET

Historic Sites #:

History:
See Continuation Sheet

Significance:
The Fisher Middle School is a typical example of a mid-twentieth-century public school, displaying modernistic architectural elements including a low profile, flat roof, asymmetrical footprint, and large multi-light windows. The two buildings also display elements that were introduced into school design during the mid-twentieth century, including the use of concrete and metal and the diversification of educational spaces, such as specialized classrooms and recreational facilities. The construction of the building coincides with the post-World War II building boom and rising population in Ewing Township and throughout the country.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
The Fisher Middle School is recommended not eligible for listing in the National Register of Historic Places (NRHP). As a common example of a mid-twentieth-century school building, research did not indicate that the subject complex was associated with significant historic events or individuals. Architecturally, the construction of numerous additions, including the expansive circa-2002 rear addition, diminishes the school's integrity of feeling, association, and workmanship. The main building and administration building are both generic examples of mid-twentieth-century school architecture and do not rise to the requisite level of significance to merit inclusion in the NRHP. Research did not indicate that the subject property was associated with prominent individuals or patterns of history. For these reasons, the Fisher Middle School is recommended not eligible for listing in the NRHP under Criteria A, B, or C.

CONTINUATION SHEET

Historic Sites #:

Setting:
The Fisher Middle School is located along the southwest side of Lower Ferry Road in Ewing Township, Mercer County, New Jersey. The complex is situated on an irregularly shaped parcel (Block 367, Lot 50). The main school building, centrally located within the parcel, faces northeast, with the main entrance standing approximately 500 feet from Lower Ferry Road. The administration building is located approximately 140 feet north of the school building, facing southeast. A paved playground is situated adjacent to the rear (northwest) of this building. An asphalt driveway leading from Lower Ferry Road forms a circle with a central parking area, leading to a parking lot adjacent to the northeast of the administration building. A concrete sidewalk borders the circle, connecting to a network of concrete pathways leading to entrances surrounding both buildings. A secondary driveway leads from Lower Ferry Road, surrounds the main building, leads to parking lots to the southeast and northwest of this building, and exits at Upper Ferry Road. A track and athletic field are located in the southwest area of the parcel, along with baseball fields to the northwest. Mature trees and shrubbery are located throughout the property.

History:
The Fisher Middle School is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (TET, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing and institutional buildings in the West Trenton area. Between 1950 and 1960, the Township's population increased dramatically from 16,840 to 26,828 with development radiating outward from Parkway Avenue (CR 634) (Mueller 1918; ETPB 2006).

In January 1954, Ewing voters decided to finance the construction of a new elementary-junior high school through $1,855,000 in bonds, after Superintendent of the Ewing School District Gilmore J. Fisher advocated for the new school's need to remedy overcrowding (TET, 25 January 1954:1, 20 April 1954:5). Calls for construction bids were placed the following month, with plans calling for a 38-room school (TET, 16 February 1954:3). Most of the site was previously public land owned by the township, but a portion was farmland purchased from Joseph R. Cunningham (TET, 20 April 1954:5). Bids were awarded in April 1954, with the general contract given to Belli Company, Inc., a Trenton construction company founded in 1920 which also built various commercial buildings, as well as Mercer County Community College. Analysis of the bids selected shows structural steel was utilized in the construction and that available excess funding would be used to furnish terrazzo flooring in select rooms (TET, 29 April 1954:8; The Trentonian, 29 January 1980:58). Ground was broken for the subject school in August 1954, with plans to open in September 1955 (Figure 1; TET, 22 August 1954:13). Work was delayed due to strikes among carpenters and sheet metal workers, causing the construction's focus to shift solely towards classroom construction to meet the beginning of the school year deadline. Work was diverted from the central section of the school, containing the kitchen, cafeteria, auditorium, gymnasium, shops, and music rooms, to the ends of the school, which were divided with junior high classrooms at one end and elementary classrooms at the other (TET, 16 August 1955:15). Despite ongoing work to the school's central section, the Ewing Junior High School opened on time in September 1955, with work scheduled to be completed by November (Figure 2; TET, 18 October 1955:2).

The design of the Ewing Junior High School displayed some characteristically mid-century modern elements, as well as features common to schools of this era, including a diversification of educational spaces, classrooms, and recreational facilities; however, the design of the subject school came shortly before a major overhaul of school design that occurred in the late 1950s. As mentioned in a 1957 Courier-Post article, there was a shift in school architecture just two years after Ewing Junior High School was completed towards more modular, open concept learning environments. This change stemmed from an identified need for more flexibility in teaching spaces and a focus on individuality. Some of these changes were reflected in school design, included isolating the cafeteria and gyms from classrooms utilizing

Historic Sites #:

History, continued:

separate buildings; connecting individual classroom blocks by open walkways to reduce costs; and the use of moveable wall panels to create a more dynamic and flexible learning environment (The Courier-Post, 11 June 1957:9). Aerial imagery from 1957 shows the original layout of the subject school, built on the site which was previously farmland and woodlands. The building footprint was irregular, roughly-L-shaped, with the extant athletic fields, circulation route surrounding the building to the northeast, and a southeast parking lot to the rear of the building (NETR 1953, 1957). By 1959, the subject school was given the name of Gilmore J. Fisher Elementary-Junior High School, after the superintendent who organized its construction (TET, 22 October 1959:7). In 1962, the administration building was constructed to the northwest of the circular driveway, with an associated parking lot, and a wing was added to the northeast corner of the school building (TET, 4 December 1961:21; see Plate 5). Between 1970 and 1979, a wing was added to the northwest of the school building (NETR 1970, 1979). Newspaper articles indicate that at some point in the late twentieth century, the name of the subject school was shortened to the Fisher Middle School, implying that a separate elementary school was likely constructed around that time and elementary grades removed from the subject school. Issues with overcrowding cropped up again in the late 1990s, and additions were suggested to both the Ewing High School and the Fisher Middle School. At the middle school, it was decided to construct a rear addition paralleling the main block, which would be kept intact, allowing the school to continue functioning during the school year (TET, 19 December 1999:4). Circa 2002, the south addition was added to the school building, along with a new main entrance, with aerial imagery from that year showing construction in progress. Changes included the removal of the original rear parking lot and the construction of new parking lots within the circular driveway and adjacent to the southeast and northwest sides of the building, connected by a new driveway leading from Lower Ferry Road to Upper Ferry Road around the rear of the school building (NETR 2002). In 2013, the southwest addition to the administration building was constructed (NETR 2013).

Work Started On Ewing Junior High School

Ewing Township's new junior high-elementary school begins to take shape on Lower Ferry Road. Its opening, a year away in September 1955, is expected to end half-day sessions in the township. The $1,855,000 plant will have 38 rooms.

Exterior Description, continued from Base Survey Form:
The dormers above the primary (northwest) and southwest elevations feature coupled windows. Primary-elevation windows are also flanked by inoperable vinyl shutters. The primary elevation has an off-center entrance with a metal screen door and an oval-light sash door. A set of wood steps leads to a 1955 front porch supported by simple wood posts with a wood balustrade. The symmetrical southwest elevation includes typical windows. In addition to typical windows, the northeast elevation is pierced by a fixed-pane hexagonal window and a glazed vinyl door. The symmetrical rear (southeast) elevation has a rear entrance including a vinyl sash door. The foundation is not visible.

Interior Description:
The subject property is a privately owned parcel. Access to the property by Richard Grubb & Associates, Inc. was limited to the exterior and did not include interior access to the building.

Setting:
The dwelling at 1290 Lower Ferry Road is located along the southeast side of Lower Ferry Road in Ewing Township, Mercer County, New Jersey. The subject dwelling is situated on an irregularly shaped parcel (Block 230, Lot 66), facing northwest, approximately 45 feet from Lower Ferry Road. An asphalt driveway leads to the rear (southeast) of the dwelling. A concrete path leads from the driveway to the main entrance and a concrete sidewalk borders the property to the northwest. Mature trees and shrubbery are located in proximity to the dwelling. The property is located adjacent to the southwest side of a restaurant, divided from the adjacent property by a wood fence bordering the rear yard. The area surrounding the subject property primarily consists of mid- to late twentieth-century residential and commercial buildings.

Significance:
The dwelling at 1290 Lower Ferry Road is an example of a vernacular dwelling built circa 1910 with a 1955 front porch addition. The dwelling, although one-story in height, displays vernacular Prairie-style influences including its low-pitched hipped roof with overhanging eaves, hipped dormers, and full-width front porch. The construction of this dwelling coincides with the rise of the automobile and the post-World War II building boom in Ewing Township and throughout the country.

Eligibility for New Jersey and National Registers: ☐ Yes ☒ No **National Register Criteria:** ☐ A ☐ B ☐ C ☐ D

Level of Significance ☐ Local ☐ State ☐ National

Justification of Eligibility/Ineligibility:
The dwelling at 1290 Lower Ferry Road is not eligible for listing in the National Register of Historic Places (NRHP). Research did not indicate that the subject property was associated with prominent individuals or patterns of history. Architecturally, the building retains a high degree of integrity of location, setting, feeling, and association; however, it is a common and unremarkable example of its type, not highlighted by any characteristic design elements or materials or the work of a master. Furthermore, the replacement of exterior windows, doors, and siding has diminished its integrity of design, workmanship, and materials. For these reasons, 1290 Lower Ferry Road is recommended not eligible for listing in the NRHP under Criteria A, B, or C.

CONTINUATION SHEET

Historic Sites #:

History:

The dwelling at 1290 Lower Ferry Road is located in Ewing Township, Mercer County, in what is commonly known as the West Trenton Area. Ewing Township was primarily rural and characterized by large agricultural properties during the first half of the twentieth century; however, military and industrial development surrounding Mercer Field (present-day Trenton-Mercer Airport) significantly drove residential and commercial development during the mid-twentieth century onward. During the early 1950s, the County regained ownership of Mercer Field from the federal government and converted the former military airport into a commercial airport with a goal of encouraging industrial growth in the surrounding area (TET, 22 August 1952:1). The increase in job opportunities drew in more residents and, as a result, required more housing in the West Trenton area. A rising population throughout the second half of the twentieth century necessitated further commercial development and greater recreational opportunities. As the community evolved through the subsequent decades, more intensive development occurred, responding to the broader community need, including several planned residential communities (Ewing Township Planning Board 2006; Mueller 1918; NETR 1931, 1947, 1963, 1970). In 1955, the school now known as Fisher Middle School was constructed adjacent to the northwest of the subject property (TET, 27 October 1955:15).

In 1955, Peter Yurcho received approval for a building permit to construct the extant front porch addition to the subject dwelling for $300 (TET, 12 June 1955:41). Yurcho, a shipping clerk, likely resided at the subject dwelling with his wife Caroline and daughter Sandra (United States Census Bureau [USCB] 1950). In 1957, the property was sold to Thomas and Katherine Dorio. Thomas worked in an auto assembly factory and Katherine owned a retail food store. The couple likely resided at the subject dwelling along with their three children (USCB 1950). Construction began on the Hickory Hill Estates housing development, adjacent to the east of Lower Ferry Road in 1959 (TET, 14 June 1959:37). Completed by 1962, this development transformed the surrounding area from a primarily agricultural expanse into a suburban neighborhood (TET, 24 June 1962:44). According to stylistic evidence, 1290 Lower Ferry Road has undergone window, door, and siding replacement since its construction.

EXECUTIVE SUMMARY

Richard Grubb & Associates, Inc. (RGA) completed a Phase IB archaeological survey for the removal of an existing air traffic control tower (ATCT), the construction of a new tower and associated parking lot, and the installation of a utility duct bank at the Trenton-Mercer Airport in Ewing Township, Mercer County, New Jersey. It is RGA's understanding that this project is receiving funding from the Federal Aviation Administration (FAA), necessitating compliance with Section 106 of the National Historic Preservation Act of 1966, as amended. RGA completed a Phase IA historical and archaeological survey that assessed a roughly 2.37-acre portion of the Area of Potential Effects (APE) with a high sensitivity for pre-Contact period Native American archaeological resources based on proximity to wetlands and predictive modeling site settlement data. Areas of assessed high archaeological sensitivity were recommended for Phase IB archaeological survey to determine the presence or absence of intact archaeological resources.

The Phase IB archaeological survey comprising background research, pedestrian reconnaissance, excavation of 45 shovel test pits (STPs), artifact analysis, and report preparation. Testing was completed within the archaeologically sensitive portion of the APE, which consisted of undisturbed grassy areas within 500 feet of the former alignment of the West Branch Shabakunk Creek. Subsurface testing within the APE recovered 10 historic artifacts. These artifacts are ferrous metal hardware, wire nail fragments, brick fragments, vessel glass, and domestic ceramic. Diagnostic artifacts are either modern or possess wide date ranges from the early nineteenth century to the present day. No accompanying archaeological features, structural remains, or pre-Contact artifacts were identified. No pre-Contact period cultural features were encountered. The recovered artifacts do not represent evidence of any on-site occupation and do not represent an intact archaeological site. No further archaeological survey is recommended within the APE.

1.0 INTRODUCTION

Richard Grubb & Associates, Inc. (RGA) completed a Phase IB archaeological survey for the removal of an existing air traffic control tower (ATCT), the construction of a new tower and associated parking lot, and the installation of a utility duct bank at the Trenton-Mercer Airport in Ewing Township, Mercer County (Figures 1.1–1.3). On November 20, 2024, RGA completed a Phase IA historical and archaeological survey was to assess the potential for the presence of pre-Contact or historic archaeological resources in the Area of Potential Effects (APE) and to recommend the completion of a Phase IB archaeological survey in such areas. The Phase IA survey assessed a roughly 2.37-acre portion of the APE with a high sensitivity for pre-Contact period Native American archaeological resources based on proximity to wetlands and predictive modeling site settlement data. The purpose of this Phase IB archaeological survey was to determine if archaeological resources are present or absent within the APE and to make recommendations for additional archaeological survey, if warranted.

RGA prepared this report for DY Consultants, consultant to Trenton-Mercer Airport. Theodore Gold, MA, RPA, served as the Principal Investigator, and meets the requirements of 36 CFR 61 set forth by the National Park Service (Appendix A). Allison Gall conducted background research, and Patricia McEachen produced the report graphics. Michael Gall, MA, and Emma Durham, PhD, RPA, edited the report and Dr. Durham formatted the report. Copies of this report and all field notes, photographs, and project maps are on file at offices of RGA in Cranbury, New Jersey.

This report contains several appendices that consist of qualifications for Principal Investigators (Appendix A), summary of New Jersey and National Register of Historic Places criteria (Appendix B), project plans (Appendix C), shovel test pit log (Appendix D), artifact catalog (Appendix E), unredacted report figures depicting the full APE (Appendix F), and an annotated bibliography (Appendix G).

Underground utilities are also proposed. Given their sensitivity as critical infrastructure that may be targeted by terrorist attacks, proposed utility routes are not shown on project plans or report figures per Federal Aviation Administration (FAA) requirements. Due to the need to restrict access to locational information for certain infrastructure, the utility route is not depicted as part of the APE on report figures for the version of this report intended for public consumption. The figures embedded in this report depict a partially redacted APE. A separate set of report figures showing the full APE are included in Appendix F, so that the appendix can be removed, as needed, from public-facing or publicly accessible versions of the technical report.

1.1 Regulatory Context

The FAA is the lead federal agency for the project, necessitating compliance with Section 106 of the National Historic Preservation Act (NHPA), as amended. According to Section 106 of NHPA, archaeological or historic architectural resources listed in or eligible for listing in the New Jersey Register (NJR) and National Register of Historic Places (NRHP) must be identified to determine if the project will have an effect on such resources. This report was also completed in support of an Environmental Assessment (EA) that is being prepared to address federal and state environmental review requirements. The EA is being prepared in accordance with FAA Order 5050.4B, "National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects," and FAA Order 1050.1F, "Environmental Impacts Policies and Procedures."

The survey has been carried out in accordance with the Secretary of the Interior's *Standards and Guidelines for Archaeology and Historic Preservation* and the archaeological survey guidelines of the NJHPO (1996, 2000). This report contains a discussion of the environmental setting,

results of background research, results of archaeological testing, and management recommendations. All recovered artifacts will be offered to the property owner following NJHPO review of this report.

1.2 Project Description

The proposed project includes the demolition of the existing ATCT and the construction of a new ATCT within the Trenton-Mercer Airport. The proposed new ATCT will be located approximately 2,000 feet to the southeast of the existing tower and will have a total height of approximately 117 feet, which is approximately 32 feet taller than the existing tower. The proposed tower will consist of seven floors with two break rooms, an FAA equipment room, an airport equipment room, a manager's office, and the cab on the uppermost level (see Appendix C). An Airport Rotating Beacon measuring approximately 41.25 inches in height will be installed on the top of the new tower. Approximately 10 narrow antennas and 4 15-foot-tall lighting protection air terminal masts will also be installed around the perimeter of the roof. Materials for the new tower will primarily be precast concrete and metal cladding and finishes.

Additional improvements include the following: a concrete-encased ductbank for ground-to-air communication and antenna relocation, airfield lighting connection, and navaids; a parking lot and access road for the new ATCT; and a proposed water line, gas line, and sanitary line. This project encompasses the preferred alternative for the proposed ATCT (designated the ATCT Area) (see Figure 1.3).

As described at the end of Section 1.1, the route of proposed underground utilities is not depicted on integrated report figures or construction plans per FAA guidelines (see Section 1.1 above).

1.3 Area of Potential Effects

The APE includes locations that may be impacted by construction or that may experience effects once construction is completed. The APE was defined in accordance with 36 CFR 800.16(d), which defines the APE as "the geographic area or areas within which an undertaking may directly or indirectly cause changes in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of an undertaking and may be different for different kinds of effects caused by the undertaking."

The APE includes all locations where an undertaking may result in disturbance of the ground, potentially affecting archaeological resources. Such ground disturbance includes, for instance, areas of cutting, filling, grading, excavation, demolition, subsurface utility installation, and construction staging. For the current undertaking, the APE consists of the 2.37 acres identified with high sensitivity for pre-Contact archaeological resources (see Figure 1.3).

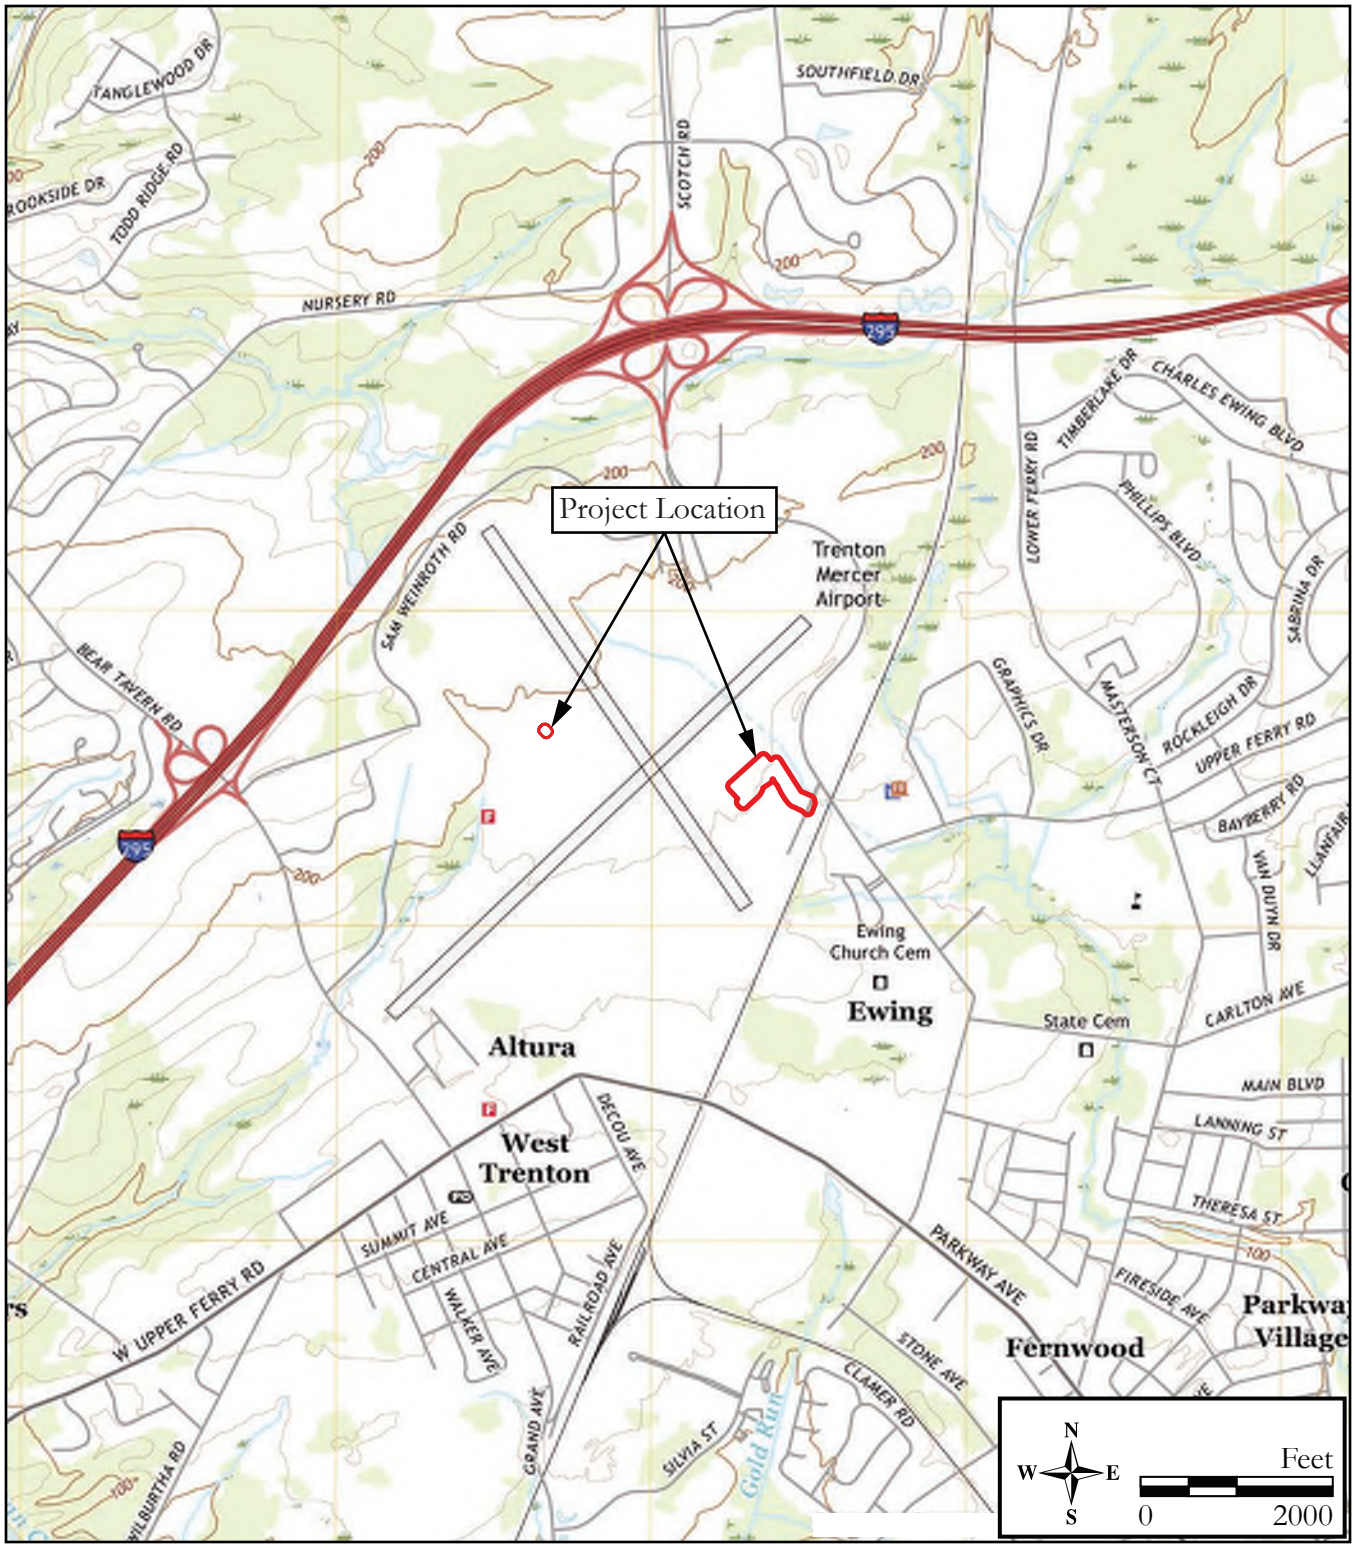

Figure 1.1: USGS map
(2019 USGS 7.5' Quadrangle: Pennington, NJ-PA).

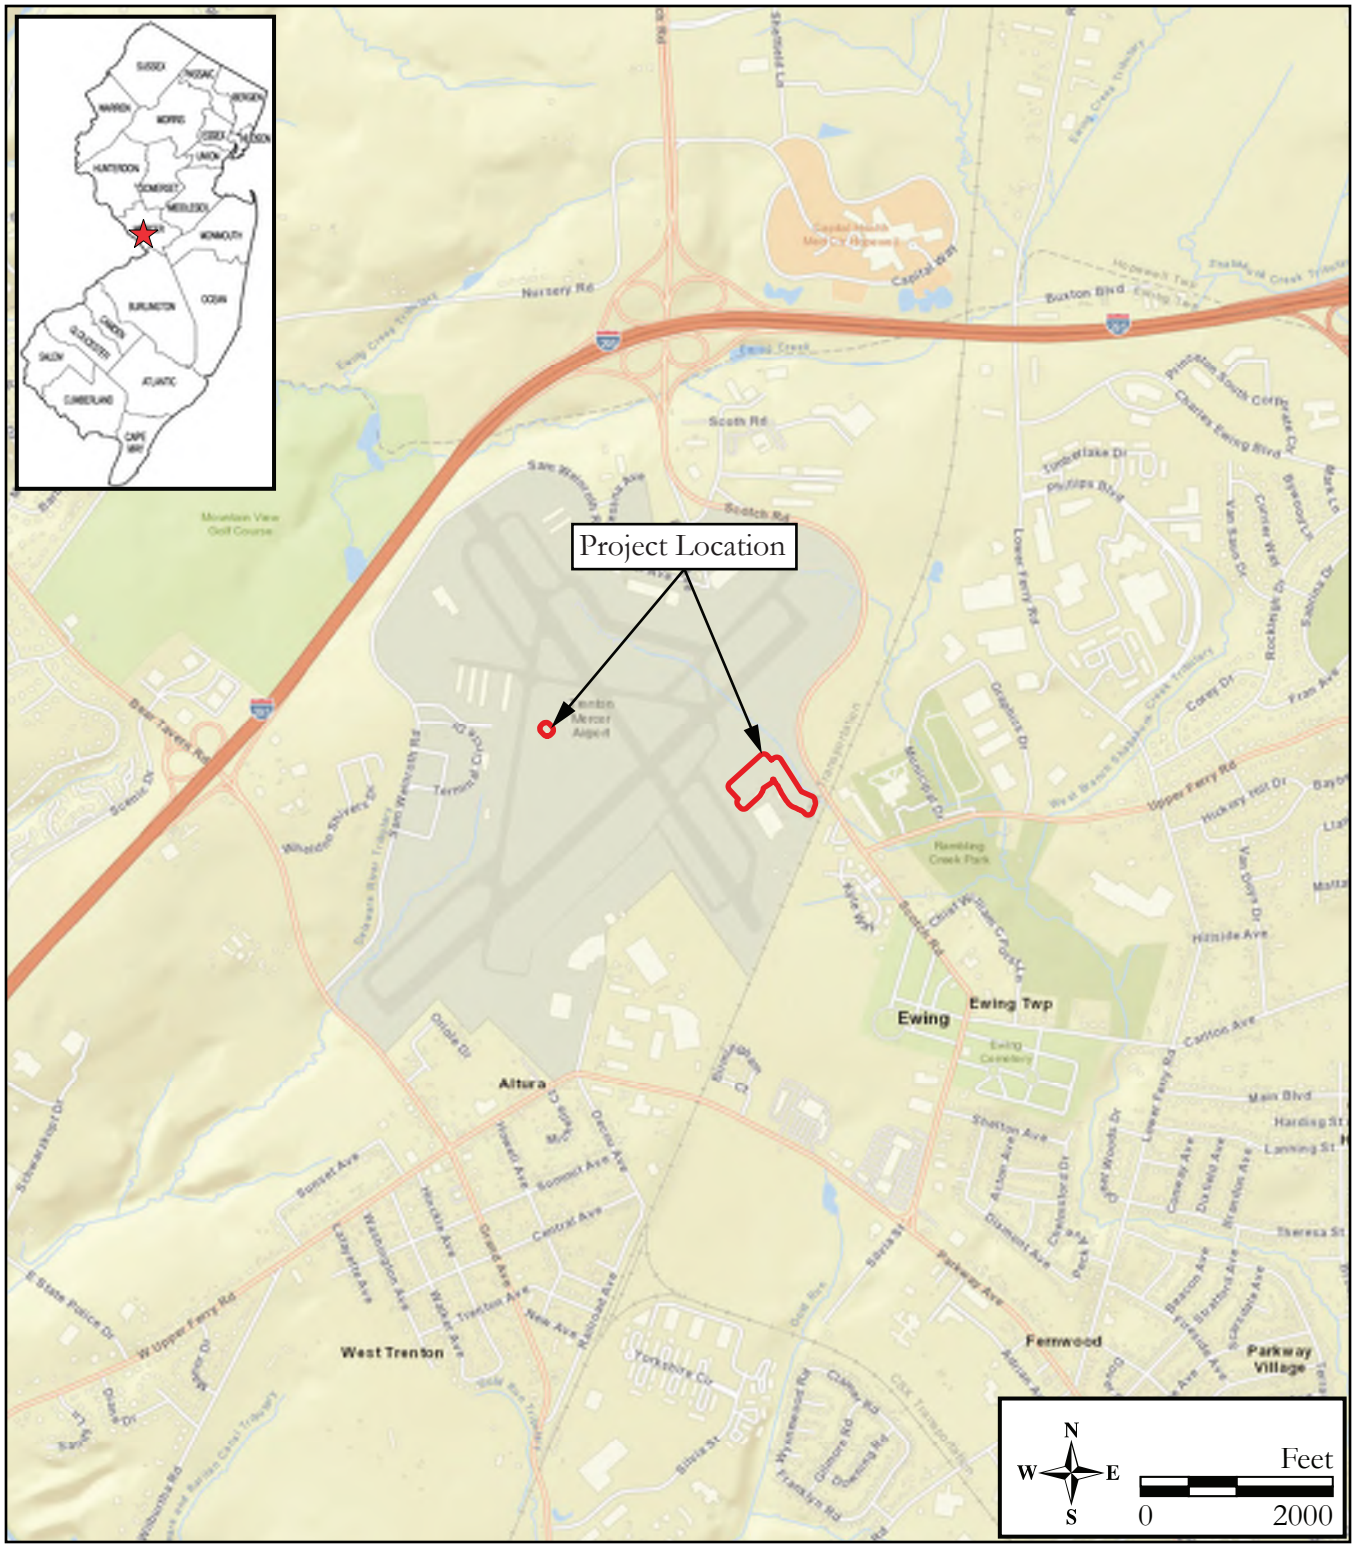

Figure 1.2: Road map
(Esri 2022).

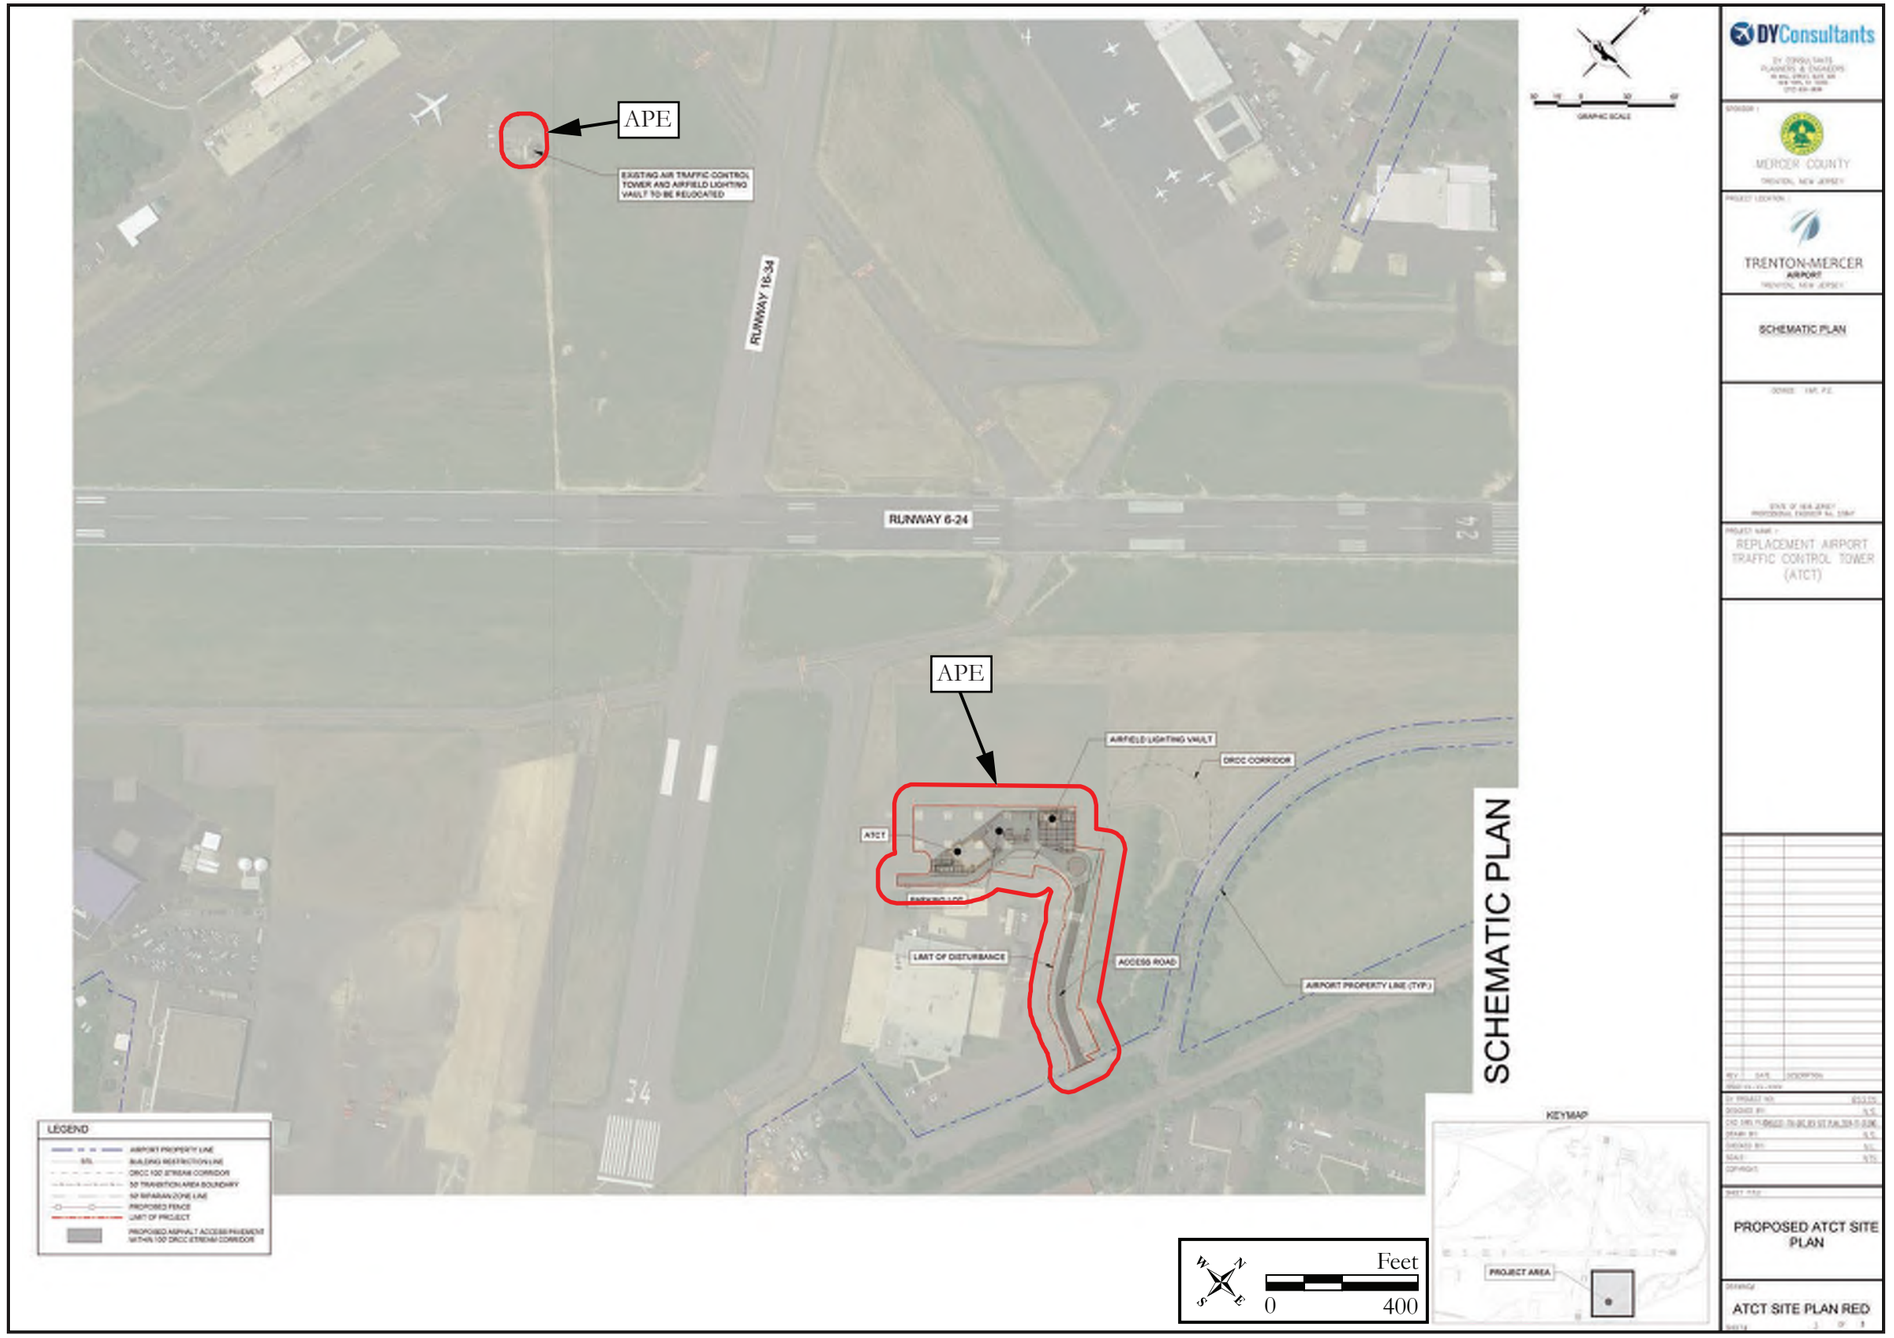

Figure 1.3: Aerial map showing the APE
(NJOGIS 2020).

2.0 PROJECT APPROACH

The purpose of this report is to present the results of a Phase IB archaeological survey to determine if intact archaeological resources are present or absent in areas of assessed high archaeological sensitivity. The research design included subsurface archaeological testing, artifact analysis, and an assessment of potential archaeological significance for identified artifact deposits in the APE.

2.1 Research Methods

Background research completed for the Phase IA archaeological survey (Richard Grubb & Associates, Inc. 2024) formed the basis of the environmental and cultural contexts presented herein. This information was updated as necessary. The initial research was conducted to determine if any documented archaeological resources were previously located within the APE. A good faith effort was made to conduct NJHPO research by reviewing the New Jersey's Cultural Resources GIS Online Map Viewer (LUCY) and the updated list of historic properties to identify resources listed in or eligible for listing in the NRHP within or near the APE (NJDEP 2023). The list of cultural resources survey reports on the NJHPO's website was reviewed to identify prior surveys conducted nearby. Reports on file at the NJHPO documenting these surveys were reviewed when possible, as well as those housed in the RGA library. Site files at the New Jersey State Museum (NJSM) in Trenton were examined via electronic communication with Curator Dr. Gregory Lattanzi to identify the location of registered archaeological sites within or near the APE. Additional background research consisted of a review of pertinent primary and secondary sources, including historic maps and atlases, historic aerial photographs, newspaper articles, and local and county histories available online and in RGA's in-house library.

2.2 Field Methods

Fieldwork comprised the excavation of 45 shovel test pits (STPs) across the APE. Shovel test pits were assigned northing and easting grid coordinates, and their locations were mapped using a Trimble Geo 7X unit, measuring tapes, compasses, and referenced existing landmarks.

The STPs measured approximately 1.5 feet in diameter and were excavated with round-nosed shovels and trowels. Each soil stratum was excavated and screened separately. Excavated soil from each STP and stratigraphic context was screened through ¼-inch wire mesh to facilitate artifact recovery. The STPs were excavated into C-horizon soils or to a depth of 3.0 feet below ground surface wherever possible unless impeded by rocks or roots. Soil characteristics and stratum designations were recorded on standardized electronic forms using iPads, and the information recorded is presented in Appendix D. Munsell charts were used to record soil color from each stratum. All excavations were backfilled, and the ground was restored to its original elevation upon completion of the testing. Photographs of field activities and general views were taken.

Modern material, such as plastic, modern vessel glass, and coal were noted and not retained. Discarded material was listed as Not Retained (NR) in the STP log (see Appendix D). Retained artifacts were placed in resealable polyethylene bags along with standardized tags denoting their provenience, including coordinates, level, depth, and stratum. Retained artifacts were processed for detailed inventory and classification at RGA's laboratory in Cranbury, New Jersey.

2.3 Laboratory Methods

Artifact processing consisted of cleaning and hand washing non-friable cultural material. Durable artifacts (i.e., ceramic, glass) were washed to remove residual soil and to facilitate identification. Less durable artifacts (i.e., metal, organic materials) were carefully dry brushed to remove residues prior to identification. Artifacts were placed in archival, 4-mil polyethylene zip lock bags. All historic artifacts were analyzed and cataloged according to provenience, material, artifact type, decorative or surface treatments(s), period of manufacture (when applicable), and artifact group, similar to those defined by South (1977) (Appendix E). All retained artifacts not indicative of a significant archaeological resource will be provided to the property owner.

2.4 Public Consultation

The views of the public are essential to informed decision-making pertaining to regulated activities; therefore, members of the public were informed about the project and given the opportunity to comment. Organizations and individuals with an identified interest in archaeology, history, and historic preservation were contacted. Consultation was conducted during the prior Phase IA historical and archaeological survey and detailed in the November 2024 report.

3.0 BACKGROUND RESEARCH

Background research was conducted to locate previously identified archaeological and historic architectural resources in the vicinity of the project location and to assess the potential for previously unidentified cultural resources within appropriate cultural contexts. Research methods are described in Section 2.1.

3.1 Environmental Setting

The APE is located within the Piedmont Physiographic Province and is underlain by dolomitic or silty argillite, mudstone, sandstone, siltstone, and minor silty limestone of the Lockatong Formation (Figure 3.1; Owens et al. 1998; Wolfe 1977). Surficial sediments include Pleistocene-age weathered shale, mudstone, and siltstone (Newell et al. 2000). Soils mapped within the APE consist of moderately well-drained Udorthents, bedrock substratum with 0 to 8 percent slopes (UdbB) (Figure 3.2; NRCS 2021). Extensive ground leveling activities have taken place associated with the airport's construction since the mid-1940s.

The APE is located west of Scotch Road on a flat to moderately undulating topographic setting characterized as uplands, at an elevation ranging between 160 and 200 feet above mean sea level. The West Branch Shabakunk Creek adjoins the eastern boundary of the APE and is routed underground through a pipeline aqueduct. A 1940 aerial photograph does show a wooded portion of the branch just west of Scotch Road, adjacent to the APE, which was later modified and made into a lagoon between 1971 and 1979 (Nationwide Environmental Title Research [NETR] 1940, 1971, 1979). The West Branch flows into Shabakunk Creek 3.3 miles east of the APE, which subsequently flows into Assunpink Creek, the Delaware River, and eventually into the Atlantic Ocean. Vegetation and ground cover within the APE consists of manicured grass and asphalt-paved surfaces.

3.2 Pre-Contact Period Context

Archaeologists organize chronological and cultural information about the pre-Contact occupants of New Jersey and the Middle Atlantic region into three broad time periods: Paleoindian ±13,000–10,000 BP, Archaic 10,000–3000 BP, and Woodland 3000 BP–400 BP/AD 1600 (Chesler 1982; Custer 1996; Grossman-Bailey 2001; Kraft 1986, 2001; Mounier 2003). These temporal periods serve as a chronological framework for the interpretation of archaeological data. The Archaic and Woodland periods are further subdivided into Early, Middle, and Late sub-periods. A section on the Pre-Clovis period has been included for additional context.

This chronology terminates at approximately AD 1600, marking roughly the initial contact between Native groups and Old-World populations, and is followed by a period of extensive colonization by the Dutch, Swedish, and English. These periods act as a general framework in order to study the approximately 13,000 years of human occupation in the area. It should be noted that studies of pre-Contact material culture and radiocarbon dates have increasingly determined that the above dates are approximations and do not represent definite or distinct chronological boundaries between material cultures associated with each pre-Contact period. Instead, temporal overlap between material culture styles suggest fluid rather than abrupt technological transitions over time and demonstrate that more radiometric dates are needed to better understand pre-Contact chronologies (Stewart 2018). Localized settlement pattern studies have helped to refine this Middle Atlantic pre-Contact chronology with reference to subsistence strategies and occupational patterns (Fitting 1979; Marcopul 2007; Mounier 1978; Pagoulatos and Walwer 1991; Wall et al. 1996). For each temporal period, environmental conditions, diagnostic artifacts, and cultural characteristics are briefly summarized.

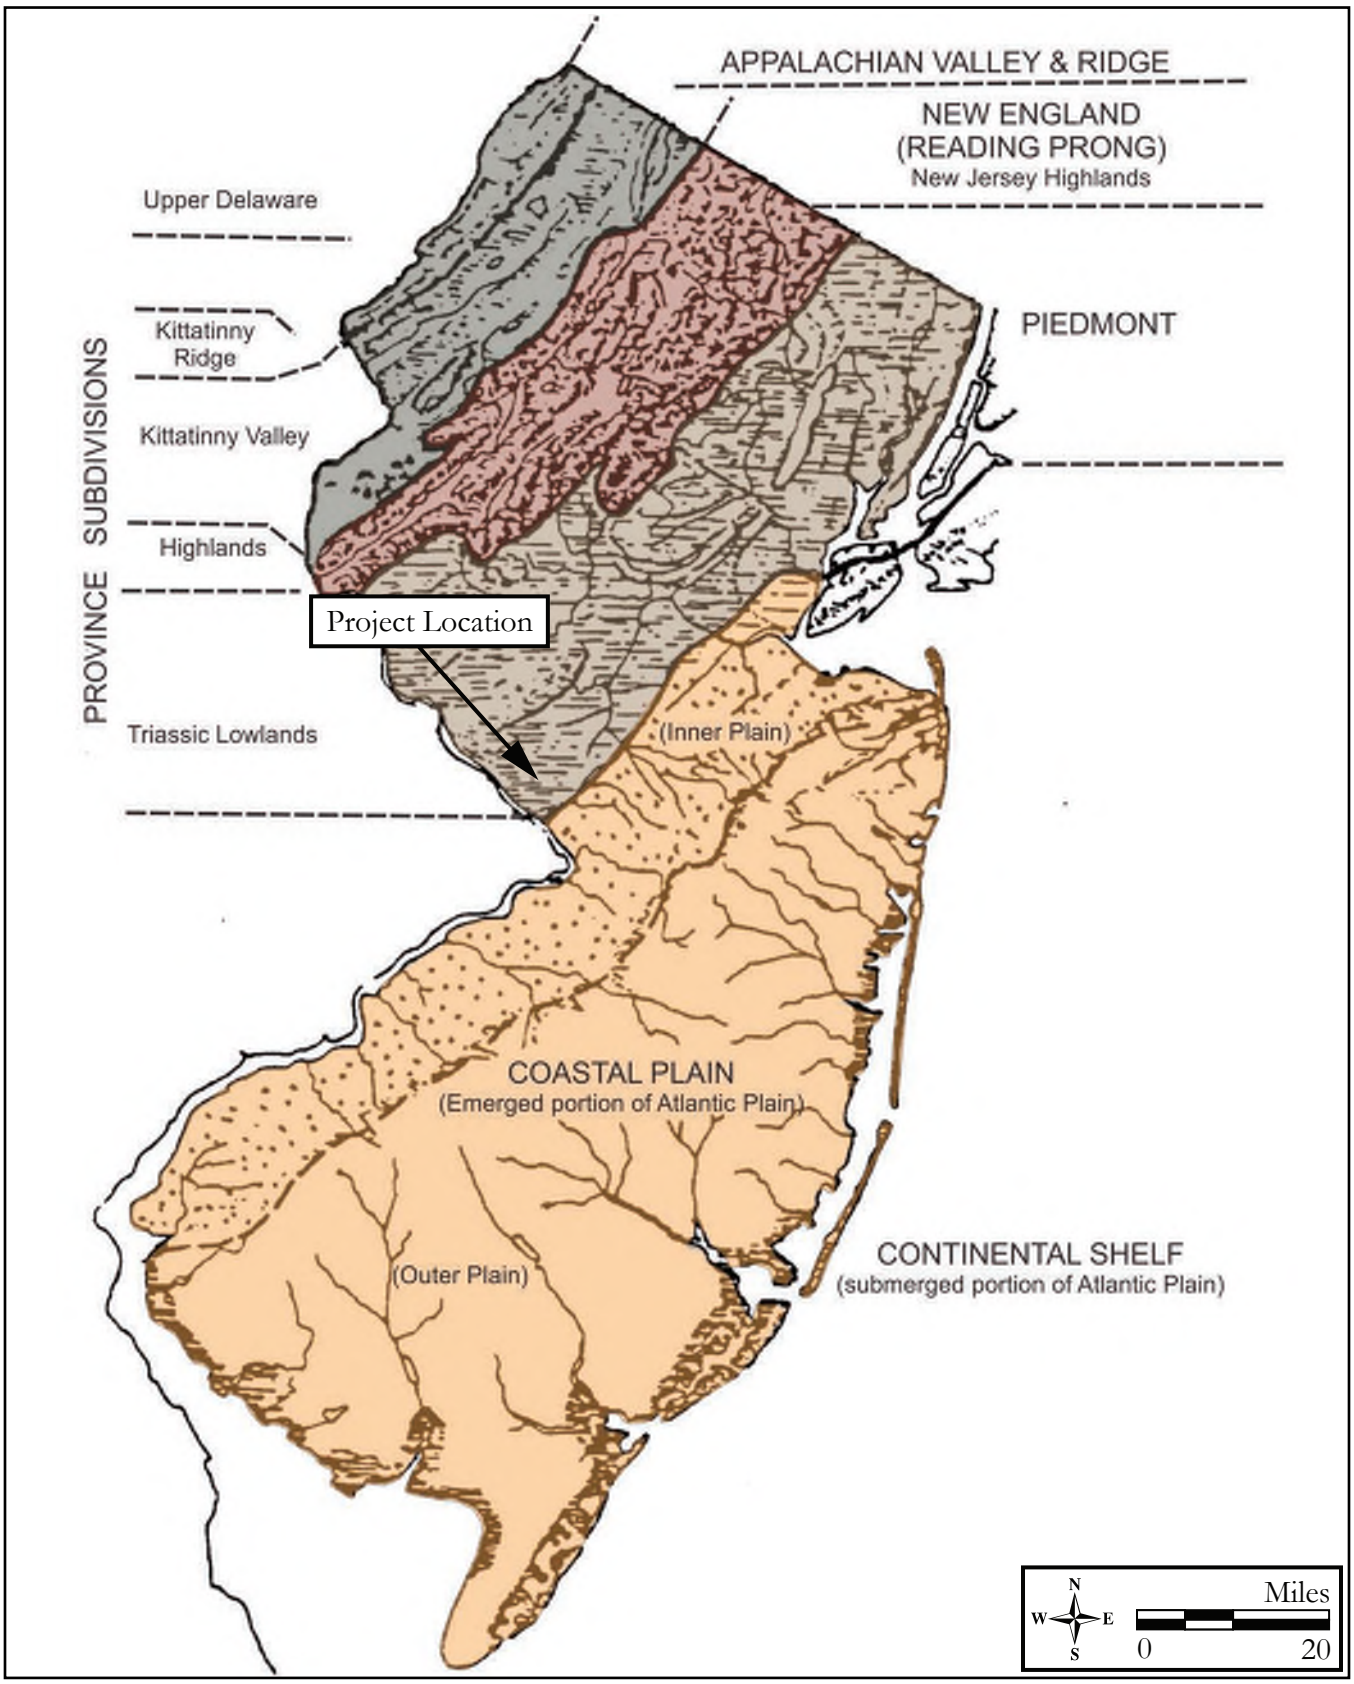

Figure 3.1: Physiographic provinces map
(adapted from Wolfe 1977).

(2021 Soil Survey Staff, Natural Resource Conservation Service, United States Department of Agriculture. Soil Survey Geographic [SSURGO]).

Pre-Clovis Period (circa 16,500 BP–±13,000 BP)

There is increasing evidence for earlier (Pre-Clovis) occupation in the Americas (Carr 2018; Miller and Gingerich 2013), including Monte Verde in Chile (Dillehay 2000), Meadowcroft Rockshelter in Pennsylvania (Adovasio et al. 1990), Miles Point in Maryland (Carr 2018), Cactus Hill in Virginia (MacPhail and McAvoy 2008; McAvoy and McAvoy 1997; Wagner and McAvoy 2004), and Topper in South Carolina (Goodyear 2005). Pre-Clovis sites include a technology consisting of flake tools, small bifacial projectile points, blade-like or elongated flakes, and use of retouched or utilized flakes (Carr 2018). No Pre-Clovis sites have been identified in New Jersey.

Paleoindian Period (±13,000–10,000 BP)

The Paleoindian period represents the initial occupation of the Northeast following deglaciation. Major coastal plain landscape features likely influenced the occupational patterns of Paleoindian groups, including interior wetlands, periglacial features, cuestas, low terraces, deep river channels, estuaries, and dendritic drainages formed from glacial melt (Grumet 1990; Kraft 1986, 2001; Marshall 1982; Pagoulatos 1998). Areas of tundra, spruce, pine, and deciduous vegetation occupied microniches across New Jersey, influencing faunal patterns (Kraft 2001; Marshall 1982). Early Paleoindian inhabitants likely hunted large and small game, and supplemented their diet with collected wild plants, nuts, and aquatic resources (Carr and Adovasio 2002; Custer and Stewart 1990; Dent 1991; Gingerich 2011; Marshall 1982). Evidence from the Shawnee-Minisink Site in the Upper Delaware Valley, for instance, suggests a subsistence regime whereby fishing and plant foraging, including hawthorn plum, berries, and hickory nut, supplemented game hunting (Gingerich 2011; Stewart 2007). Paleoindians were likely organized as highly mobile bands, and sites dating to this period often consist of small encampments. Relatively few Paleoindian sites have been documented in the New Jersey Piedmont (Pagoulatos 2004:130). Two well-documented Paleoindian sites in northern New Jersey, the Plenge and Zierdt sites, are open-air sites located on terraces along the Musconetcong and Delaware rivers, respectively (Gingerich 2013; Kraft 1973; Werner 1964). The Dutchess Quarry Cave site in Orange County, New York, however, suggests that rock shelters and caves were also used by Paleoindians (Funk 1976; Kopper et al. 1980). Toolkits recovered from sites often include fluted projectile points, scrapers, flake tools, and debitage.

Early Archaic Period (10,000–8500 BP)

The lifeways of Early Archaic period peoples were likely similar to those during the end of the Paleoindian period, as this transition was not marked by a punctuated change, but rather a variety of small, gradual adjustments over time (Adovasio and Carr 2009). Environmental conditions in northern New Jersey during this period included a cool climate and a mix of areas containing boreal and mast-bearing deciduous vegetation (Raber et al. 1998; Sirkin 1977). Evidence for Early Archaic occupation in northern New Jersey suggests that small, mobile bands seasonally exploited resources in riverine and coastal areas, including floodplains and river islands (Dumont and Dumont 1979; Kraft and Mounier 1982). Early Archaic diagnostic artifacts include stemmed and notched points, chipped stone choppers, and hammerstones. New tool forms suggesting adaptations to exploit forest resources, such as grinding slabs, milling stones, and pitted cobbles, have been found in Early Archaic contexts (Custer 1996). Early Archaic diagnostic notched and stemmed projectile point forms consist of Amos, Palmer, Charleston, Lost Lake, Decatur, Fort/Nottoway/Thebes, and Kirk types (Kraft 2001; Stewart 2018). Radiocarbon dates are documented for limited Kirk point types in the Upper Delaware Valley and range between 9000 and 8000 BP, including at the Harry's Farm and Rockelein sites in the Upper Delaware Valley (Stewart 2018).

Middle Archaic Period (8500–5000 BP)

Ongoing environmental change in the Middle Atlantic region increased deciduous, mast-producing vegetation, which offered additional food resources (Custer 1989; Kraft 2001). These changes coincide with an apparent population increase during the Middle Archaic period in New Jersey, though social groups were still limited in size. Occupation of riverine and stream settings continued with increased exploitation of estuarine settings and deciduous wooded uplands (Carr and Moeller 2015:87; Kraft 2001; Kraft and Mounier 1982). Evidence suggests decreased settlement mobility during the Middle Archaic, a departure from Paleoindian and Early Archaic lifeways. By the end of the Middle Archaic,

toolkits included woodworking tools, including axes, adzes, and gouges, manufactured through pecking and grinding of durable metamorphic and sedimentary stones. These implements could be used in felling trees and hollowing logs for canoes (Custer 1996; Kraft 2001). Middle Archaic diagnostic bifurcate projectile points are classified as MacCorkle, St. Albans, and LeCroy. Certain Kirk forms date to the Middle Archaic period. Other distinctively Middle Archaic diagnostic types include Neville and Stanly projectile points with shallow basal notching (Custer 2001:45). New lithic sources were sought and quarried, including argillite and shale from north-central New Jersey and Cohansey quartzite from southern New Jersey (Grossman-Bailey 2001:211–223; Kraft and Mounier 1982). Various types of notched, bifurcate-base, and stemmed projectile points were used to tip spears for hunting, sometimes used in a stone-weighted atlatl.

Late Archaic Period (5000–3000 BP)

The Late Archaic is characterized by adaptation to a more temperate climate, stabilized sea levels, and tidal conditions along the region's large rivers and streams (Kraft and Mounier 1982; Ritchie 1965). The beginning of the Late Archaic period roughly corresponds to the late middle Holocene warm, dry Sub-Boreal period (Carr and Moeller 2015; Stewart 2018). An increase in the number and size of sites during this period suggests a greater population, likely due to environmental changes which offered an increased food supply (Custer 1996; Kraft 2001; Kraft and Mounier 1982). Other major cultural developments during this period include the growth and expansion of long-distance trade networks and increased sedentism. Decreased social group mobility may have resulted in territorialization, spurring the development of trade networks (Kraft and Mounier 1982; Pagoulatos 1998; Stewart 1989). Larger Late Archaic sites were typically located in resource-rich areas along major rivers, with smaller campsites, procurement stations, transient camps, and isolated activity areas in a variety of settings (Custer 1984; Kraft 2001). Mortuary ceremonialism has also been documented for the Late Archaic period, as evidenced by such sites as Savich Farm and Koens-Crispin (Cross 1941; Hawkes and Linton 1916; Regensburg 1971).

In addition to material types discussed previously, a number of additional tools emerged or became more common on Late Archaic sites, including mortars, milling stones, pestles, nutting stones, sinew stones, shaft smoothers, atlatl weights, and plummets (Kraft 2001). During the latter portion of the Late Archaic, vessels carved from steatite (with sources in Pennsylvania and New England) emerged for food preparation (Kraft 2001). Argillite exploitation and use increased substantially during the Late Archaic (Stewart 1989, 1994). A variety of notched and stemmed projectile points (i.e., Bare Island, Brewerton, Lackawaxen, Lamoka, Macpherson, Normanskill, Pequea, Piney Island, and Poplar Island) were used throughout this period, and new forms were introduced, including broadspear (Susquehanna, Savannah River, Snook Kill, Lehigh/Koens-Crispin, and Perkiomen) and fishtail types (Custer 2001; Stewart 2018).

Early Woodland Period (3000–2500 BP)

Many Late Archaic lifeways continued into the Early Woodland period. Defining a clear temporal boundary between these periods is problematic due to the increasing number of radiocarbon dates associated with diagnostic artifacts such as early ceramics, steatite vessels, and fishtail points (Carr and Moeller 2015:107; Stewart 2003:5, 2011, 2018). The occupational model for the Early Woodland suggests seasonal aggregation of social groups in semi-sedentary, riverine base camps, with cyclical movements to satellite encampments and procurement areas in interior settings (Custer 1996; Hummer 1994; Kraft 2001; Mounier 1978; Williams and Thomas 1982). Early Woodland peoples exploited plant foods associated with the Eastern Agricultural Complex, including sunflower, squash, little barley, knotweed, and Chenopodium (Carr and Moeller 2015; Messner 2011:30–31). Archaeologists have posited the emergence of a number of distinct cultural complexes during the Early and Middle Woodland periods (i.e., Orient, Meadowood, Middlesex, etc.). These cultures are distinguished by projectile point and ceramic morphologies, subsistence practices, ornamental and ceremonial artifacts, and burial ceremonialism. The practices and material culture of some of these complexes suggest an Ohio Valley influence (Bello et al. 1997; Custer 1996; Kraft 2001; Lowery 2012; Mounier 1981; Stewart 1989). Early Woodland diagnostic artifacts include Meadowood/Hellgrammite projectile points, teardrop bifaces, Adena material, and early ceramic types (Carr and Moeller 2015; Custer 1996,

2001; Stewart 2003, 2018). Ceramic types typically associated with the Early Woodland period include Marcey Creek and Vinette I (Stewart 1998a, 2018). Side-notched and stemmed projectile point types used during earlier periods continued to be manufactured and utilized during the Early Woodland.

Middle Woodland Period (2500–1200 BP)

The Middle Woodland period saw continued estuarine and tidal habitat development as slow sea level rise continued (Grossman-Bailey 2001). Developments during this period included early experimentation with horticulture and innovation and refinement of ceramic technology (Custer 1996:217; Hart 2008; Stewart 2003). Exchange networks and mortuary customs continued, but also took new forms (Kraft 2001; Lowery 2012). Populations increasingly exploited anadromous fish, shellfish, and incorporated seed crops into subsistence regimes (Hart 2008; Mounier 2003; Schindler 2006; Stewart 1999). Material diagnostic of the Middle Woodland includes Fox Creek and Jack's Reef projectile points, as well as interior-marked and crisscross cord-marked pottery (Custer 1996; Harris 2007; Stewart 1998a, 2003; Walker 2013). Middle Woodland ceramic innovations included coil-constructed pottery and net-marking surface treatment, both of which were common by the end of this period (Stewart 1998a). Evidence from the Abbott Farm Complex suggests a Middle Woodland settlement model based on seasonal aggregation and dispersal of social groups across relatively large territories. Social groups aggregated seasonally in larger semi-sedentary base camps supplied by outlying transient/procurement camps, hunting stations, and specialized encampments, dispersing later in the year to better exploit environmental resources (Wall et al. 1996).

Late Woodland Period (1200–circa 400 BP)

The Late Woodland period saw a shift in social organization and settlement patterns whereby semi-sedentary occupations within more restricted territories became common (Custer 1996; Kraft 2001; Stewart 1998b). Such changes were evidenced by the circumscribed distribution of certain pottery styles and a greater focus on local lithic resources (Custer 1996; Kraft 2001; Stewart 1987). Larger Late Woodland occupations were frequently sited on floodplains (Stewart 1991). Throughout much of the Middle Atlantic region, the Late Woodland period saw an increasing reliance on horticulture as part of the subsistence regime as plants including maize, beans, and squash were cultivated (Carr and Moeller 2015; Custer 1996; Messner 2011; Stewart 1995, 1998b). Technological changes include the use of small, triangular projectile points with the bow and arrow and the development of complex, often locally specific ceramic designs and decorative motifs (Kraft 2001; Stewart et al. 1986).

The Raritan River is sometimes defined as the boundary between proto-Unami Delaware speakers to the south and the proto-Munsee Delaware to the north. The Unami Delaware who occupied central and southern New Jersey may have interacted with other coastal groups who occupied the Delmarva Peninsula, as well as the Munsee Delaware in northern New Jersey, based on the distribution of ceramics and other artifacts (Kraft 2001; Stewart 1998b). Based on seventeenth-century ethnohistoric accounts, these linguistically related groups may have had organized polities that controlled, among other things, oystering and hunting territories during the Late Woodland and proto-historic periods (Goddard 1978:215). Shellfish gathering occurred in the spring and summer months from smaller camps and the meats were dried for later use (Goddard 1978:216–217). The restricted distribution of pottery styles and the focus on the utilization of local lithic sources along with ethnohistorical data suggest a greater degree of territoriality in the Late Woodland period than in the preceding periods (Custer 1996; Kraft 2001). The Late Woodland period terminates at the arbitrary date coinciding with contact between Late Woodland Native American populations and European explorers and colonists.

The Contact Period (circa 400–250 BP [AD 1750])

The Contact period describes the period of European exploration of the Atlantic coastline and near interior, during which early interactions began between the native inhabitants of New Jersey and Europeans. Most historians credit Giovanni da Verrazzano and Henry Hudson with initiating contact with the Lenni-Lenape and other native groups of the Northeast (Kraft 2001). Cornelius van Tienhoven traveled through the Raritan Valley in 1639, encountering a fertile floodplain that was not continuously occupied, but was well-traveled by Native American groups (Brahms 1998:22). Comparable to earlier periods, the effects and timing of these interactions vary significantly throughout the region. In New

Jersey, early European traders and fishermen made sporadic contact with Native Americans; however, the effects of these early interactions are still not understood. Mounier (2003:24) notes that prior to European settlement, there appears to have been a Native American population collapse on the coast, which may have been caused by diseases introduced during early trading interactions, combined with group decisions to relocate as incidents of conflict increased. During the seventeenth and eighteenth centuries, Native American villages, occupations, and interactions, peaceful and otherwise, were documented in early historic records (Brahms 1998; Goddard 1978; Grumet 1990; Kraft 1986, 2001; Snell 1881). In the vicinity of the APE, Native Americans continued to interact with Europeans on various levels, continuing aspects of their traditional lifeways while assimilating with the new society. Dutch and English colonists initially occupied the area for commercial reasons associated with the fur trade, as the Raritan and Millstone rivers were important travel routes and seasonally occupied by Native American groups who used the fish and shellfish resources of tidal marshes around Raritan Bay. The fertile land of the Raritan drainage quickly drew additional Dutch and English settlers. By the beginning of the eighteenth century, most Lenape had left the Raritan River Valley due to pressures from Euro-American settlers, disease, and conflict with the Iroquois to the north.

Contact period sites are rare. Williams and Kardas (1982:185) point out that by the early 1600s the Contact period is more recognizable in the archaeological record due to European settlement and the establishment of trading posts. The first colonial settlements in coastal central New Jersey were established in the mid-seventeenth century, and documentary evidence indicates that Native American settlements at the time were situated in many of the areas sought after by settlers, including along major river drainages and bays that emptied into the Atlantic Ocean, such as the Delaware River drainage (Williams and Kardas 1982).

Local Pre-Contact Context

In conjunction with the Scudder Falls Bridge replacement project, the Delaware River Joint Toll Bridge Commission conducted two archaeological data recoveries at pre-Contact period Native American sites located on both sides of the river (AECOM 2012a, 2012b). The nearest to the APE, the Reeders Creek West Site (28-Me-360), is situated 1.6 miles southwest of the APE in Ewing Township (AECOM 2012a). Completed in 2012, the archaeological data recovery yielded 15,898 pre-Contact Native American artifacts and documented occupations spanning from the Late Archaic to the Late Woodland periods (AECOM 2012a). It was determined that the Reeders Creek West Site likely functioned as a resource procurement and processing station occupied on a seasonal basis. Both macro-band and micro-band site types would have been established by the Lenape on broad Delaware River terraces to engage in foraging and hunting activities (AECOM 2012a). In Lower Makefield Township, Bucks County, Pennsylvania, the River Road Site (36-Bu-379) yielded 9 pre-Contact features and 3,397 artifacts dating to the Late Archaic and Late Woodland periods (AECOM 2012b). Located approximately 1.9 miles southwest of the APE, the River Road Site is a macro-band base camp with a hearth and cache feature. Smaller, micro-band camps were situated in a low swale west of a terrace bordering the Delaware River and contained a buried A-horizon revealing a living surface with evidence for the use of maize and tobacco (AECOM 2012b).

The Abbott Farm Archaeology Historic Landmark or Trenton Complex, located approximately 5 miles southeast of the APE, includes well-documented sites that represent a series of upland bluff edge and floodplain sites within the Delaware River drainage occupied from the Middle to Late Archaic to the Late Woodland periods. The Trenton Complex sites provide significant information to interpret sites throughout the Piedmont and Coastal Plains. Sites of the Trenton Complex contained numerous features and intact subsoils and yielded a wide variety of diagnostic materials, as well as organic remains used for radiocarbon dating. Based on the results of work at the Trenton Complex and in central New Jersey, Wall et al. (1996) postulate a regional settlement model consisting of four main site types: macro-social unit camps, transient camps (or procurement and processing camps), stations, and specialized camps. Macro-social unit camps are large sites found at high terraces along streams or floodplains at inland locations. Transient camps are sites located on streams or marshes that were used for a short period of time for the manufacture and maintenance of tools and for food

and resource procurement and preparation. Stations are sites used by specialized task groups for very short-term hunting activities. Wall et al. (1996:110) proposed that "populations exploited relatively large territories through seasonal aggregation and dispersal, depending on the distribution and abundance of resources." Macro-social unit camps were located at high terrace bluffs and along floodplains from early spring to late summer near the Delaware River, and from fall to winter, settlements were moved inland possibly to the Piedmont region. Transient camps and non-sedentary site types supplied the base camp with necessary resources, such as game animals, lithic materials, fish, and other materials. The model is based on seasonal migration and social groups that divide and reunite to better exploit the environment while maintaining social and cultural ties.

3.3 Historic Context

Due to the varying scales on historic maps and because existing landmarks are not always accurately represented, the term project location is used within this section and on some historic map figures.

The project location lies within Ewing Township, in a section often referred to as West Trenton due to its proximity to the city. Ewing Township was formed from Trenton Township in Hunterdon County in 1834 and was among the lands incorporated into Mercer County four years later, in 1838. Mercer County underwent several more boundary changes and settled on its current configuration in 1845. Ewing Township's current boundaries were established in 1900 (Snyder 1969:161–162).

Prior to the turn of the eighteenth century, there were very few colonial settlers north of present-day Trenton. Andrew Smith, who settled in what is now Ewing Township, was one of the first to establish himself in the area as a yeoman farmer on 200 acres of land prior to 1688 (Hunter and Porter 1990:25). Most of the European settlers who purchased land and settled near the project location in the eighteenth century were English families who relocated to the area from earlier colonial settlements in Long Island, East Jersey, and New England. These families were largely Presbyterian and Baptist, although there were also a small number of Quakers (Hunter and Porter 1990:26). Bear Tavern Road, located approximately 3,00 feet west of the project location and originally known as the Great Road, was one of the first transportation routes in the area, built circa 1700 (Hunter and Porter 1990:169; John Milner Associates, Inc. 2010:25). As the eighteenth century progressed, the local population grew, demand for farmland increased, and more uninhabited land was cleared and cultivated. This in turn fueled the construction of additional roadways to connect the new settlers with established settlements and markets (Hunter and Porter 1990:26).

During the Revolutionary War, roadways in and around the project location, including Bear Tavern Road, were used by military forces (Figure 3.3; Faden 1777; Munn 1976). The developed places closest to the project location in the late eighteenth century were Pennington (approximately 3 miles to the north) and Trenton (approximately 4 miles to the southeast) (Figure 3.4; Hills 1781). Bear Tavern Road served as a thoroughfare between present-day Titusville and Trenton, which were active hubs for troop movements prior to and after the Battle of Trenton in 1776 and the Battle of Assunpink Creek in 1777 (John Milner Associates, Inc. 2009; Munn 1976). General George Washington's crossing of the Delaware River occurred approximately 3 miles northwest of the project location. Approximately "1,500 men and 10 pieces of cannon" traversed present-day Bear Tavern Road under Major General Sullivan and General Green (see Figure 3.4; Faden 1777). No structures were mapped within or proximate to the project location in the late eighteenth century (Faden 1777; Hills 1781).

In 1833, Scotch Road had been established and the nearest mapped mill or manufactory to the project location was situated approximately 1 mile to the northeast in present-day Hopewell Township along a tributary of Jacob's Creek (Figure 3.5; Gordon 1833). Gordon's 1833 map depicts the old footprint of Scotch Road intersecting with a road proceeding east from Birmingham. This road was the predecessor of present-day Upper Ferry Road, and the project location lies directly north of this intersection.

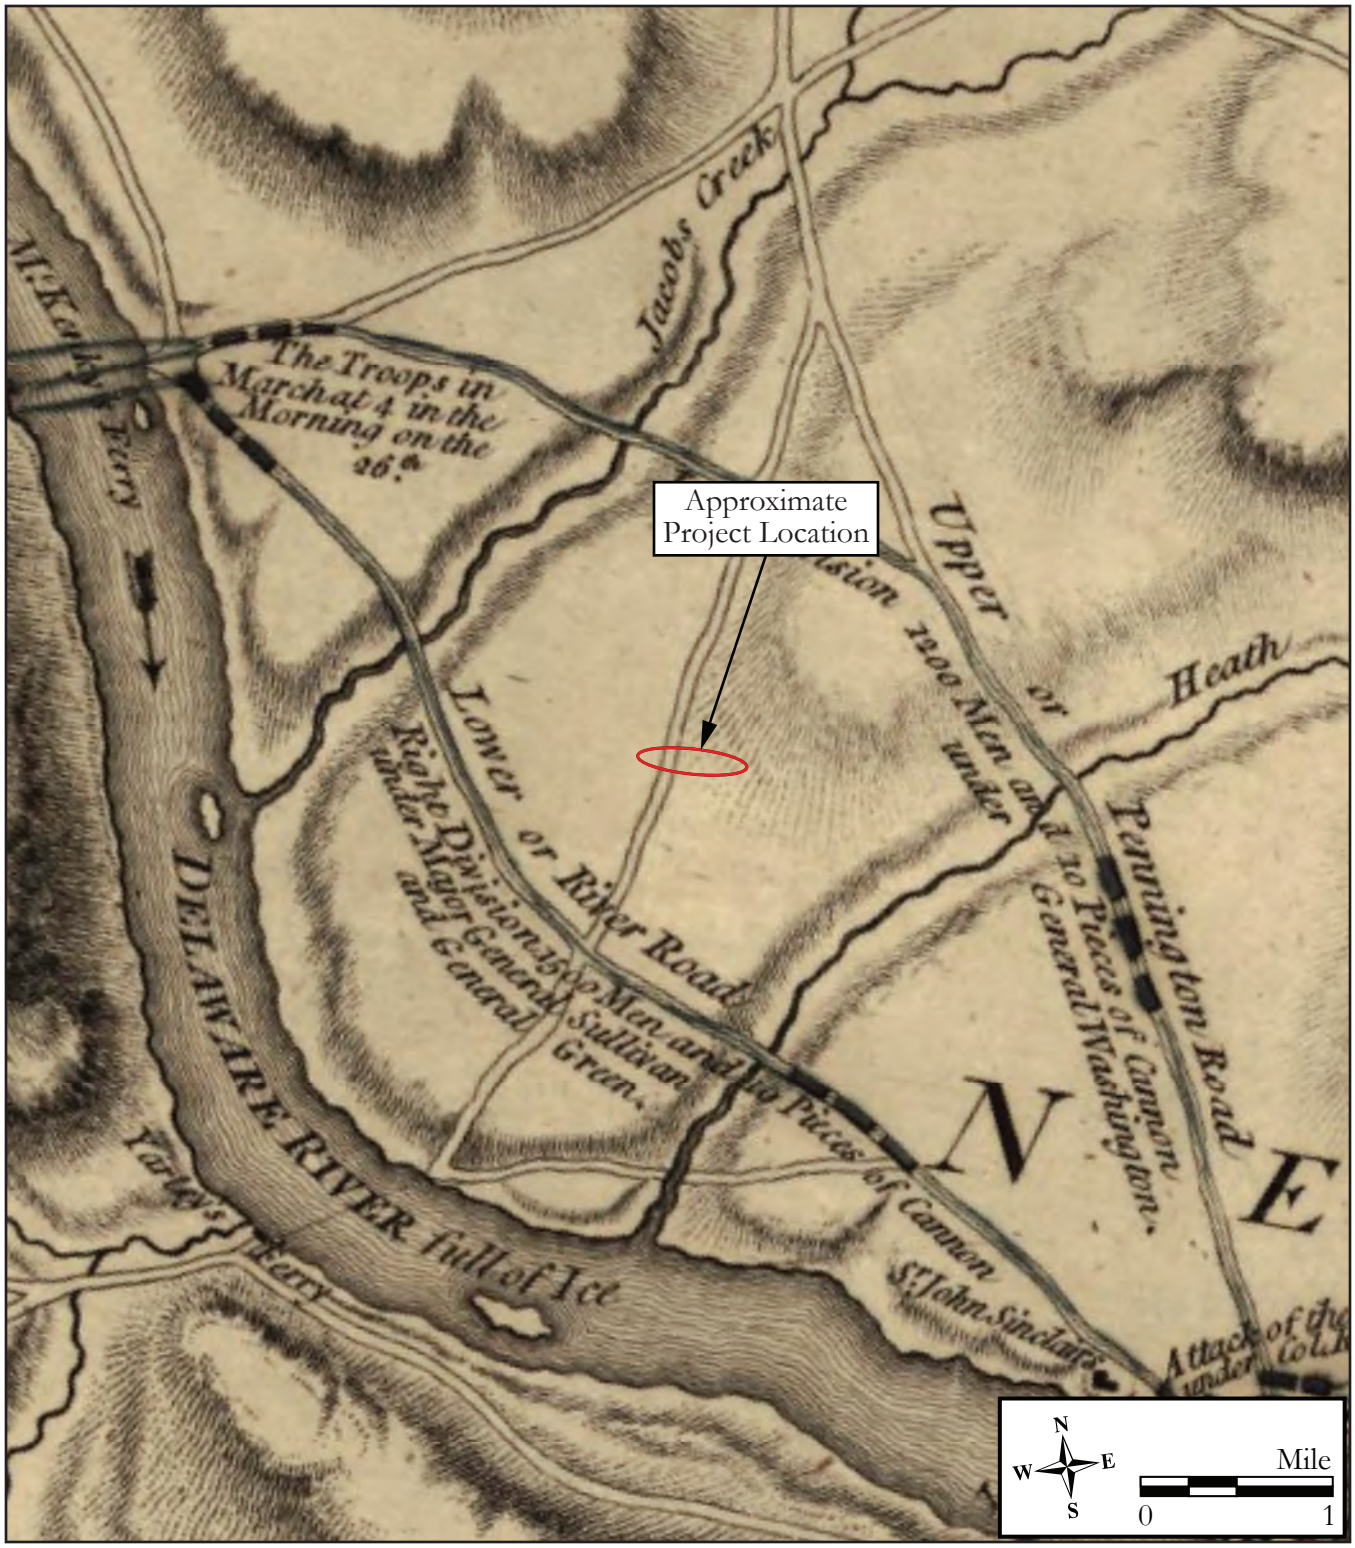

Figure 3.3: 1777 William Faden, *Plan of the Operations of General Washington, against the Kings Troops in New Jersey, from 26th of December, 1776, to the 3rd January 1777.*

Figure 3.4: 1781 John Hills, *A Sketch of the Northern Parts of New Jersey.*

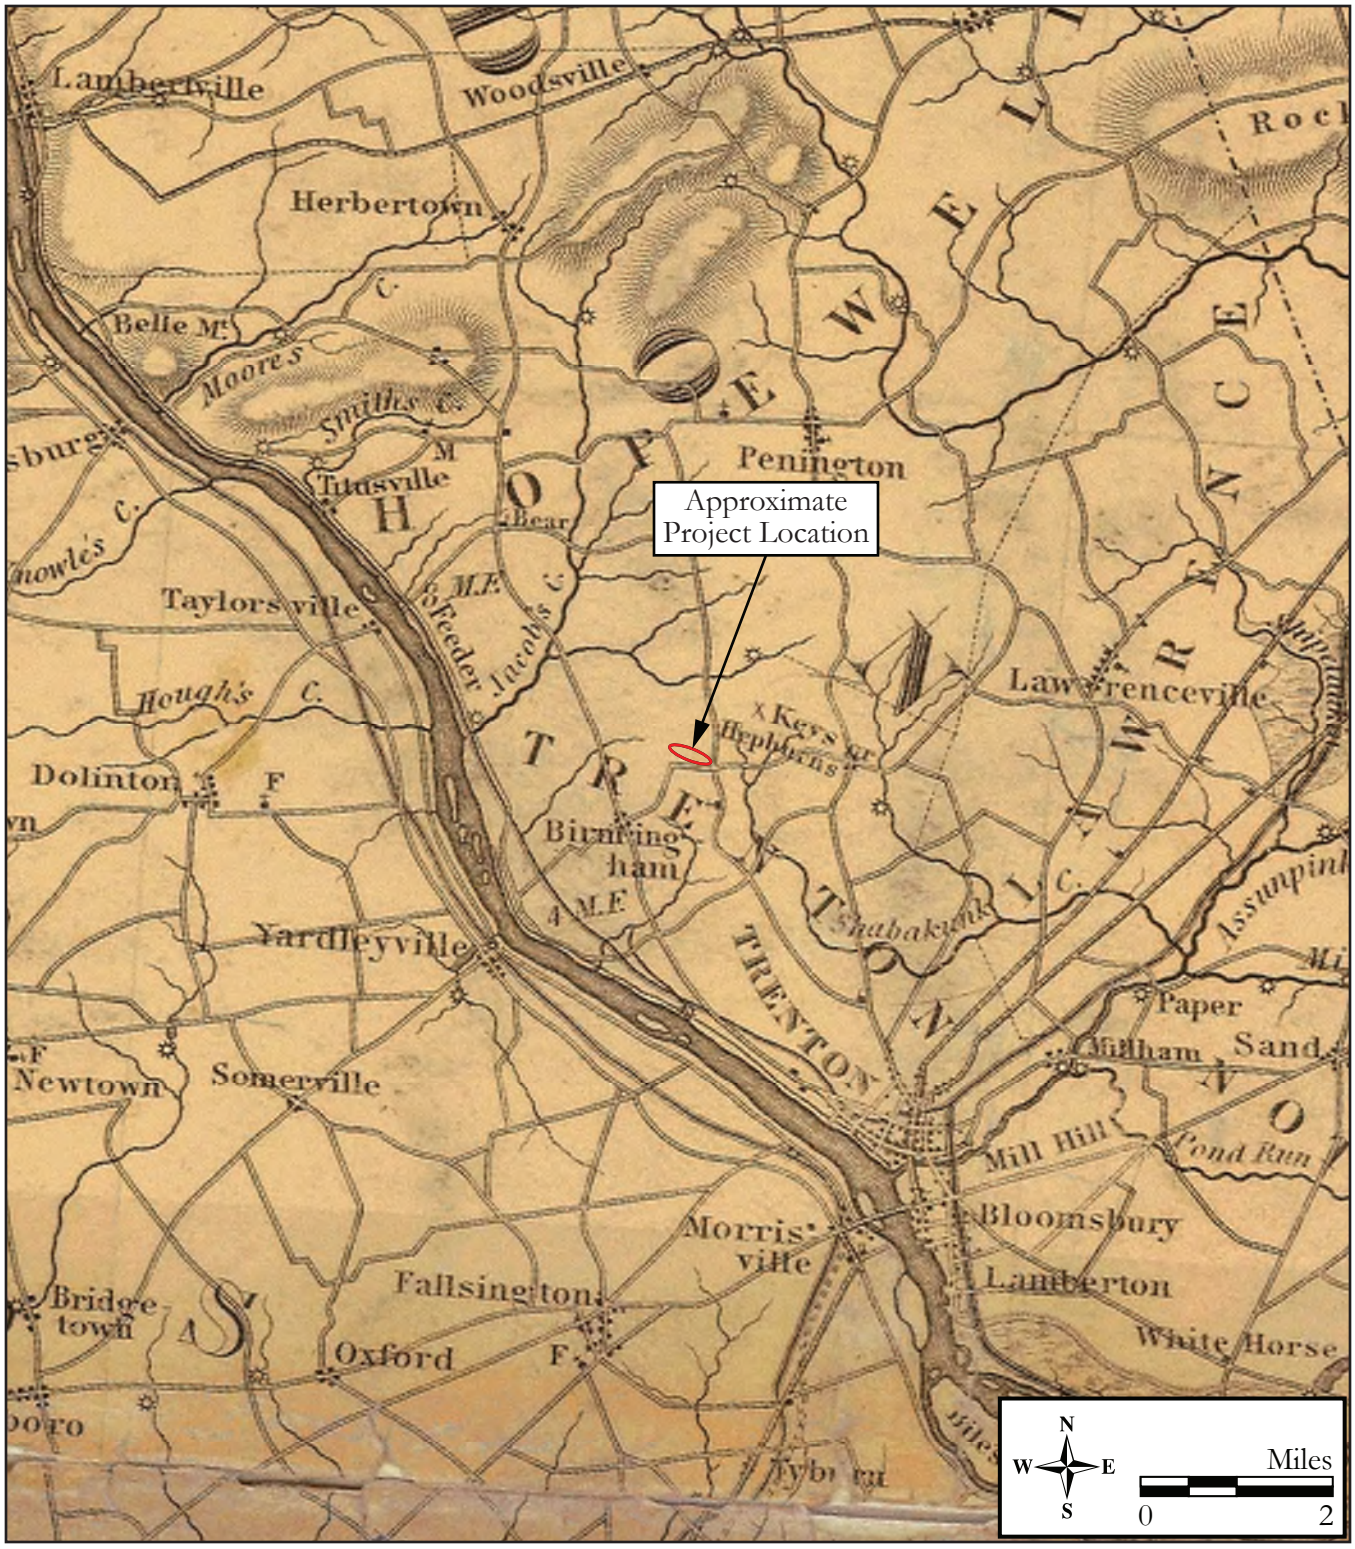

Figure 3.5: 1833 Thomas Gordon, *A Map of the State of New Jersey with part of the adjoining States.*

In 1849, several dwellings were mapped in the vicinity of the project location (Figure 3.6; Otley and Keily 1849). These include the residences of O. Howell and a map-documented building with an unattributed owner southeast of the William McIlvane residence. The O. Howell residence stood 540 feet to the west of the project location and the house with the unattributed owner stood 130 feet to the east and was separated from the project location by a tributary. McIlvaine, who owned a house that stood 475 feet north of the project location, was a judge of the Court of Common Pleas in Mercer County for 15 years (Woodward and Hageman 1883:790).

By the last quarter of the nineteenth century, the population had increased along Bear Tavern Road and Scotch Road, and the Delaware and Bound Brook Railroad (D&BBRR) had been constructed directly southeast of the project location in the vicinity of Scotch Road (Figure 3.7; Everts & Stewart 1875). The McIlvaine residence, then owned by Edward Shippen McIlvaine, William's son, is mapped 475 feet north of the project location and an unattributed building stood 130 feet east of the project location on the opposite side of a tributary (Woodward and Hageman 1883:790). The L. Ivens' house, formerly owned by O. Howell, is mis-plotted on the map and stood 540 feet west of the project location. The Ivens family was a noted family in Hamilton Township (Woodward and Hageman 1883:798). The area southwest of the project location east of the railroad contains a dwelling owned by McIlvaine and a wheelwright machine shop. An area north of the project location belonged to the Vernam family (see Figure 3.7).

By 1890, the project location is mapped within the properties of "Howard McIlvain," likely a descendant of William and property owned by "Alex L. Ivans" (Figure 3.8; Scarlett and Scarlett 1890). To the north is a parcel owned by "Jno Vernam" and to the south is a tract owned by "Jno Coleman." The Ewing Railway Station and two other structures are mapped in the southern vicinity of the project location, which otherwise retained much of its rural character by the beginning of the twentieth century (Figure 3.9; USGS 1906; NETR 1931, 1940). A 1906 USGS map shows four buildings within the vicinity of the project location, likely parts of the Ivans and McIlvain properties (see Figure 3.9; USGS 1906).

Aerial photography shows the dwellings and associated farm fields directly west of the D&BBRR (Figure 3.10; NETR 1931, 1940). One building was located at the corner of Scotch Road and Upper Ferry Road, likely one of the McIlvain properties (NETR 1940). By 1947, land within and surrounding the project location was cleared and graded to make way for runways and airport facilities (NETR 1947). The former Ivans house was razed by the mid-1940s and the portion of Upper Ferry Road situated west of Scotch Road had been removed (NETR 1947). Development continued to occur within the project location throughout the mid-twentieth century in the form of vegetation clearing, grading, and runway and building construction (Figure 3.11; NETR 1947, 1953, 1957, 1958). Between 1958 and 1963, the portion of Scotch Road northeast of the project location was realigned to its present location (NETR 1958, 1963). Between 1971 and 1979, the West Branch Shabakunk Creek was redirected via underground pipeline along the northeast portion of the project location (Figure 3.12; NETR 1971, 1979). By 1995, construction within the project location had slowed, with only a handful of buildings being erected on the property during the twenty-first century (NETR 1995, 2019). Numerous utilities were also installed in the area between the ATCT building and the terminal to the southeast (Figure 3.13; Google Earth 2021).

Trenton-Mercer Airport

Established during the early 1940s in Ewing Township, Mercer County, the Trenton-Mercer Airport was the second airport built in what is commonly known as the West Trenton area. The first airport, known as the Mercer Airport, was built during the late 1920s by the Mercer County Board of Freeholders and located to the northwest of the present-day airport complex, on the land now occupied by the Mountain View Golf Course (Block 372, Lots 1, 4, 5, 10–12). By October 1927, the Mercer Airport contained a primitive grass landing that was initially used by mail pilots (Trenton Evening Times [TET], 24 January 1928:9). Shortly after, the Mercer County Board of Freeholders committed to building a full-service airport and approved $50,000 for the effort (TET, 17 April 1928:1). A portion of the allotted funds was used to purchase the Hervey Scudder Farm along Bear Tavern Road, and, in February 1929, the freeholders advertised for bids to construct the first aircraft hangar on the site to

accommodate at least 10 airplanes, a mechanical shop, administration office, and gas station (TET, 1 February 1929:13). The Mercer Airport officially opened in August of that year, in conjunction with Trenton's 250th anniversary, with a dedication ceremony featuring an aerobatic demonstration that attracted 2,000 spectators (Tesauro 2002:25). By 1930, Mercer Airport offered personnel for servicing and maintenance, repair facilities, gas and oil, telephones, and meals (Airport Consultants, Inc 1930).

The old Mercer Airport continued to operate until the early 1940s; however, three months after the United States entered World War II, it was determined that the Mercer Airport was not big enough to accommodate military aircraft activity. This led to the Mercer County Board of Freeholders announcing plans to construct a new airfield immediately southeast of the existing airport and set the foundation for the present-day Trenton-Mercer Airport. Originally known as Mercer Field, the three intersecting runways were built by the Civil Aeronautics Board in 1942 (TET, 9 March 1949:1). Essential buildings such as hangars and barracks were built by the federal government before the airfield was officially commissioned by the United States Navy in July 1943 to operate as the Naval Aircraft Delivery Unit (Stell Environmental Enterprises, Inc. 2013:5-3). An early 1940s *Map of Mercer Field* depicts the naval facilities built in the north section of the airport complex which included a total of 39 buildings and structures, a few of which were repurposed and are still extant today. The remaining Naval buildings include: the Main Storehouse, the Vehicles Maintenance Shop and Public Works Shop, the Welding Shop, and the Paint Chemical Storage and Photo Lab (National Archives Catalog n.d.). The old Mercer Airport was officially closed in March 1942 (Reilly 1997:110).

Not long after the establishment of Mercer Field, the General Motors (GM) Ternstedt plant, located south of Parkway Avenue along the southern terminus of the airfield, was incorporated into GM's Eastern Aircraft Division. The Ternstedt plant was initially used to manufacture automobile hardware but, in 1941, the plant was shut down by the government to curtail the use of vital war materials. Shortly after, the Eastern Aircraft Division was formed, and GM converted the plant into an aircraft factory to support the war effort and to test aircrafts for the United States Navy (TET, 3 March 1942:11). During the war, 7,500 Avenger torpedo bombers were produced at the GM Ternstedt plant and then tested at Mercer Field for military service (TET, 23 January 1955:13). Eventually, the Navy would go on to test more than 15,000 planes at the airfield (TET, 23 January 1955:13).

By the end of World War II, the 1945 AAF Airfield Directory described the Mercer Airport as a 305-acre property having two sod runways and three hangars, although "not in operation" (Freeman 2019). Following the war, the housing shortage led to discussions about using the naval barracks on the property for Veteran housing; however, it is unclear whether or not the empty facilities were actually used (TET, 11 December 1945:1). In 1947, the Mercer County Freeholders requested that the government return ownership of Mercer Field, along with "all its buildings, land, facilities, and equipment," so that air service could be provided to the greater Trenton area (TET, 22 October 1947:2). Although the Mercer County Freeholders did not have ownership at the time, they began looking to lease the airport facilities to a large company that would manage the airfield and provide adequate service to the surrounding community (TET, 22 October 1947:2). It was also during this time that the Navy informed the Mercer County Board of Freeholders that it planned to build a test facility on the 74-acre parcel adjacent to Mercer Field along Parkway Avenue. The site was designated as the Naval Aeronautical Turbine Test Station (NATTS) and officially opened on November 4, 1955. For the next several decades, the laboratory, located southeast of the airport, was in full operation and later played an integral role in the development of military technology during the Cold War (Louis Berger & Associates, Inc. 1996; NETR 1953).

Preparations for turning Mercer Field into a commercial airport began in 1949 with ownership and maintenance of Mercer Field still in discussion between the County and the federal government (TET, 9 March 1949:1). The airport was not used for seven years, and, during this time, the runways and facilities sat idle and were not well maintained. It was not until 1952 that the Department of Defense and the Navy canceled the lease on the airfield and the government finally surrendered the facility back to the Mercer County Board of Freeholders (TET, 21 September 1947:9, 23 March 1949:1, 10 January

1952:3). Although the Navy cancelled their lease on the airfield, a new 20-year lease was drafted for "all Navy-owned property north of Ridge Road known as the barracks area" (Stell Environmental Enterprises, Inc. 2013:5-3).

During the early 1950s, the County saw Mercer Field as an opportunity to encourage industrial growth in the area. In August 1952, Chase Aircraft signed a 99-year lease for 54 acres of land within the airport in the empty section near Bear Tavern Road. They began plans to build "several work hangars and added office space" (TET, 22 August 1952:1). A 1953 historic aerial suggests that Chase Aircraft likely built the hangar building (no longer extant) shown approximately 1,950 feet northeast of Bear Tavern Road along present-day Sam Weinroth Road (see Figure 3.11; NETR 1953). In an attempt to turn the airport back into a civilian enterprise, Mercer County Freeholder John E. Curry worked with Allegheny Airlines to offer flights to the general public. In 1955, civilian commercial passenger service began at Mercer Field, and within just three years, the airport had hosted 30,000 private and commercial flights (Trenton Sunday Times-Advertiser, 26 April 1959:1). Several buildings were constructed within the airport complex during the 1950s, including the present-day HomeFront Family Campus building which was originally built as a Naval Communications Unit during the Cold War and then repurposed into the "Naval Communications Unit No. 11" in 1957 for the former Inspector-Instructor West Trenton Facility (Stell Environmental Enterprises, Inc. 2013:5-3; NETR 1953, 1957).

By the 1960s, the conversion of Mercer Field into a modern air center was well underway, and a county publication for the Tercentenary Commission reported several improvements completed by the County. The improvements included extending the runways, the construction of a new control tower, and installment of an all-weather instrument-landing. In addition to the new Air Traffic Control Tower, two additional buildings were constructed during the 1960s, including a Garage and the building that currently houses the Johnson and Johnson Aviation Hangar. It was also during this time that the airport name was changed for the first time to Mercer County Airport (Gemmell and Havens 1964). In 1969, a fire broke out at the airport, leveling a large hangar and the Allegheny Airlines waiting room and office and the airport restaurant. Multiple aviation fleets were destroyed, causing damage exceeding $3 million (TET, 15 April 1969:3). After Allegheny Airlines threatened to withdraw flights, the county began constructing a temporary terminal, consisting of two trailers and an 800-foot runway extension in 1970 (TET, 27 January 1970:50). Most of the early-1940 naval buildings were demolished in the late 1960s and 1970s (NETR 1969, 1971, 1979).

The current Trenton-Mercer Airport Terminal was completed in 1976 (NETR 1979; TET, 8 January 1975:31). That same year, the New Jersey Army National Guard constructed the maintenance hangar and army aviation support facilities east of the runways to the west of Scotch Road's intersection with the railroad (HDR, Inc. 2015). The facility was developed as a heliport and continues to be used by the New Jersey Army National Guard today (HDR, Inc. 2015:26). By 1979, the smallest and westernmost runway that abutted the new airport terminal was converted into a taxiway and seven more buildings were erected within the airport complex, including the Vehicle Maintenance Building, a Garage, the Lighting Equipment Room, the East Hangars, the Signature Aviation Hangar, and two circa-1975 Hangars (see Figure 3.12; NETR 1979). Development within the airport complex continued throughout the late twentieth century with the Fire Station, a Gun Shed, a Storage Building, the Salt Dome, the Fueling Station, and some of the Corporate Hangars (NETR 1995). The county-owned airport officially became the Trenton-Mercer Airport in 1995.

During the twenty-first century, several more Corporate Hangar buildings were erected, and the Pfizer, Inc. Hangar, the Trenton Corporate Air Wing Hangar, two garages, a Utility Building, a Hangar, and the Office Building were all constructed by 2010 (NETR 2002, 2004, 2006, 2007, 2008, 2010). Around 2011, the former Chase Aircraft building was demolished and turned into a parking lot (NETR 2010, 2012). Sometime around 2015, the former Naval Communications Unit No. 11 was drastically renovated to its current appearance and function as the HomeFront Family Campus (Stell Environmental Enterprises, Inc. 2013). The most recent building erected within the complex is the Luggage Building, which was constructed around 2014 (see Figure 3.13; Google Earth 2021). It is located just north of the Trenton-Mercer Terminal Building. Presently, Trenton-Mercer Airport is a joint civil-military public airport.

3.4 Known Archaeological Sites and Prior Investigations

New Jersey State Museum Site Files

A review of the NJSM site files and published references (Cross 1941; Skinner and Schrabisch 1913) indicated that no registered archaeological sites are located within the APE. Five registered archaeological sites are located within a 1-mile radius of the APE (Table 3.1). The nearest known pre-Contact site is the Runway 6 Site (28-Me-387), located 3,600 feet southwest of the APE, which yielded non-diagnostic artifacts comprising eight flake fragments, one sandstone cobble tool, and two hearth rocks from shallow, predominately disturbed soils. The nearest historic site is the Trenton-Mercer Airport Archaeological Foundation Site (28-Me-390), situated 2,200 feet east of the APE, which consisted of stone masonry structural remains composed of schist, shale, and brick mortared with Portland cement. The age and function of the structure, which is situated adjacent to railroad tracks, is unknown.

Table 3.1: Registered archaeological sites within a 1-mile radius of the APE.

Site Number/ Name	Period/Type	Distance/ Direction from the APE-Archaeology	Closest Water Source/Distance	Reference
28-Me-271	Pre-Contact, unknown date/ Lithic scatter	4,000 feet/North	Ewing Creek/ 660 feet	NJSM
28-Me-272/ Welling-Hough Farmstead	Historic, mid-nineteenth to early twentieth century/ Farmstead	3,350 feet/Northeast	Ewing Creek/ 330 feet	NJSM
28-Me-370/ Hart Farmstead	Historic, early eighteenth- to mid-nineteenth-century/ Farmstead	4,380 feet/North	Ewing Creek/ 850 feet	NJSM
28-Me-379/ Burroughs-Dobbins Historic Site	Historic, late nineteenth-century/ Domestic deposits	2,600 feet/Southeast	Delaware River tributary/ 1,160 feet	NJSM
28-Me-387/ Runway 6	Pre-Contact, unknown date/ Lithic scatter	3,600 feet/Southwest	Delaware River tributary/Adjacent	NJSM
28-Me-390/ Trenton-Mercer Airport, Archaeological Foundation	Historic, unknown/ Stone-masonry foundation (unknown function)	2,200 feet/East	West Branch Shabakunk Creek tributary/380 feet	NJSM

APE – Archaeology: Area of Potential Effects for Archaeology
NJSM – New Jersey State Museum files

Cultural Resources Surveys

A review of files at the NJHPO indicated that four prior archaeological surveys have been conducted within or adjacent to the APE (Crossroads of the American Revolution National Heritage Area 2011; GAI Consultants, Inc. 1991; Mounier 2015; Richard Grubb & Associates, Inc. 2019, 2024).

GAI Consultants, Inc. (1991) conducted a Phase I cultural resources investigation along portions of the West Branch Shabakunk Creek in conjunction with a flood control project for the U.S. Army Corps of Engineers. The Trenton-Mercer Airport was included within the survey's study area; however, no subsurface archaeological testing was conducted within or adjacent to the current APE and no further archaeological survey was recommended (GAI Consultants, Inc. 1991).

A broad-based cultural resources survey entitled *Crossroads of the American Revolution, National Heritage Area Management Plan, Part II Implementation Plan* was published in 2011 and details the Crossroads of the American Revolution's policies, guidelines, actions, and plans for cultural heritage programs to

develop a better understanding of the American Revolution in New Jersey. Based on the information provided, no battles or skirmishes occurred within the APE (Crossroads of the American Revolution National Heritage Area 2011).

In 2015, a Stage IA survey of the Trenton-Mercer Airport was conducted in conjunction with an obstruction removal project involving the proposed removal of trees and other structures that posed potential aviation hazards (Mounier 2015). The survey encompassed areas to the north, southeast, and southwest of the current APE. A Stage IB survey was recommended approximately 1,800 feet southwest of the current APE in an area assessed with high pre-Contact archaeological sensitivity. No further archaeological survey was recommended within or adjacent to the current APE (Mounier 2015).

In 2019, RGA conducted a Phase IA historical and archaeological survey and Reconnaissance-level historic architectural survey for proposed improvements to the Trenton-Mercer Airport (RGA, Inc. 2019). The survey included expansions to the existing terminal building to the northwest of the current APE, as well as a proposed aircraft rescue and fire-fighting building directly east of the APE. No further archaeological survey was recommended at either location due to extensive disturbance from underground utilities and aboveground construction (RGA, Inc. 2019).

In 2024, RGA completed a Phase IA historical and archaeological survey for the current project and assessed the eastern 2.37 acres of the APE with high pre-Contact archaeological sensitivity based on the proximity to a tributary of the West Branch Shabakunk Creek. RGA recommended a Phase IB archaeological survey within the archaeologically sensitive portions of the APE (Richard Grubb & Associates, Inc. 2024).

4.0 RESULTS

Fieldwork in the form of subsurface testing and documentation was conducted on December 16 and 17, 2024, by Ed McFadden, Ryan Belle, and Phoenix Strouse. Fieldwork consisted of the excavation of 45 STPs placed at 50-foot intervals within areas of assessed high archaeological sensitivity in the APE (Figure 4.1; Plates 4.1–4.17).

The southern portion of the APE adjoins Upper Ferry Road and consists grassy medians adjoining a paved parking lot leading up to the fenced-in NJARNG facilities (see Figure 4.1; see Plates 4.1–4.3). Within the NJARNG facilities, the APE-Archaeology consists of manicured grass and paved surfaces related to the nearby helipad and associated structures (see Plates 4.4–4.10). East of the fenceline, the APE consists of a cleared grassy area adjoining the tree line associated with the West Branch Shabakunk Creek tributary (see Plates 4.11–4.14). This area is visibly lower than the adjoining portion of the APE within the airport fenceline (see Plates 4.15–4.17).

Soil stratigraphy encountered within the STPs largely consisted of a series of redeposited soil layers (henceforth "fill") associated with twentieth-century grading episodes underlain by up to two subsoil (B1 and B2) horizons. Excavation in all but two STPs, however, was stopped by subsurface impasses, including natural bedrock or shale deposits (n=36) due to former deep truncation of the original soils from grading episodes, a high water table (n=5), or buried utility wires (n=2) (see Appendix D).

Soils were generally characterized by rocky silty loams and silty clay loams. Modern fill layers ranged in color from brown to reddish brown (10YR 5/3 to 5YR 4/2), with dark yellowish brown (10YR 4/4) being the most frequent coloration. Redeposited soils varied significantly in depth across the APE. When reached, the B1-horizon ranged from brown to yellowish-brown (7.5YR 4/2 to 10YR 5/8) silty clay loam with rocks. The B2-horizon was reached only in STP 43. There, the B2-horizon consisted of very dark brown (7.5YR 2.5/3) silty clay loam with rocks. A full log of STP stratigraphic profiles can be found in Appendix D.

Ten historic-period artifacts were recovered from fill contexts (Figure 4.2; see Appendix G). No artifacts were found in buried natural soils. The artifact assemblage consists of wire nails (n=2), brick fragments (n=2), vessel glass (n=1), whiteware (n=2), a ferrous chain (n=1), a circa-2008 padlock (n=1), and an indeterminate porcelaneous ceramic sherd (n=1). One piece of conglomerated gravel was also recovered and determined to be natural. The retained artifacts are either modern or possess non-diagnostic date ranges, though all were found in twentieth-century soil layers deposited as a result of grading episodes associated with the airport's construction.

No cultural features or structural remains were identified during the Phase IB archaeological survey, and no pre-Contact period artifacts were identified. Due to the lack of cultural features, diagnostic artifacts, or stratigraphic integrity, the artifact assemblage does not represent an intact archaeological resource and is not indicative of a former occupation locale.

5.0 CONCLUSIONS AND RECOMMENDATIONS

RGA completed a Phase IB archaeological survey within the APE for proposed improvements to the Trenton-Mercer Airport located at 1100 Terminal Circle Drive and along Scotch Road in Ewing Township, Mercer County, New Jersey. This survey was restricted to an area of assessed high pre-Contact period archaeological sensitivity within roughly 2.37 acres of the APE identified during a former Phase IA historical and archaeological survey completed in November 2024. The Phase IB archaeological survey was completed for project compliance with Section 106 of the National Historic Preservation Act, to identify the presence or absence of pre-Contact and/or historic-period archaeological resources within the APE, and to make recommendations for further archaeological survey, if warranted.

The Phase IB archaeological survey consisted of background research, pedestrian reconnaissance, excavation of 45 STPs, artifact analysis, and report preparation. Testing was completed within the archaeologically sensitive portion of the APE, which consisted of undisturbed grassy areas within 500 feet of the former alignment of the West Branch Shabakunk Creek. Subsurface testing within the APE identified 10 historic artifacts. These artifacts consist of ferrous metal hardware, wire nail fragments, brick fragments, vessel glass, and domestic ceramic. Diagnostic artifacts are either modern or possess wide date ranges from the early nineteenth century to the present day. All artifacts were found in twentieth-century fill deposits resulting from grading efforts undertaken during the airport's construction. No cultural features, structural remains, or pre-Contact artifacts were identified. The recovered artifacts do not represent evidence of an intact archaeological resource or former occupation locale. The 10 artifacts are not indicative of an intact archaeological site. No further archaeological survey is recommended within the APE.

PROFESSIONAL REGISTRATION
REGISTER OF PROFESSIONAL ARCHAEOLOGISTS

Theodore Gold is an Archaeologist at RGA with experience conducting archaeological field investigations for Phase I and II archaeological projects in New Jersey, Pennsylvania, Delaware, and Florida. Mr. Gold's experience includes in-field and laboratory artifact analysis and processing, and report writing. He has worked on cultural resources surveys completed in accordance with Section 106 of the National Historic Preservation Act and other municipal and state cultural resource regulations.

Representative Project Experience:

1771 Imperial Way, West Deptford Township, Gloucester County, NJ (Sponsor: Private Developer) As Archaeologist, oversaw Phase IB archaeological field investigations in connection with the proposed Commercial Warehouse Development in West Deptford Township, Gloucester County. The work was completed as per the archaeological guidelines of the NJ Historic Preservation Office and in compliance with the Freshwater Wetlands Protection Act (Section 7:7A).

Serruto Properties Mixed Use Development, Old Bridge Township, Middlesex County, NJ (Sponsor: Private Developer) As Archaeologist/Research Assistant participated in Phase IB archaeological field investigations in connection with the proposed Serruto Properties Mixed Use Development in Old Bridge Township, Middlesex County. The ongoing project is being conducted as per the archaeological guidelines of the NJ Historic Preservation Office and in compliance with the Freshwater Wetlands Protection Act (Section 7:7A).

County Route 537 Improvements, Freehold Township, Monmouth County, NJ (Sponsor: Monmouth County/North Jersey Transportation Planning Authority) As Archaeologist/Research Assistant participated in Phase II archaeological field investigations and cataloguing artifacts at a historic archaeological site for proposed improvements to County Route 537 in Freehold Township. The goal of the Phase II archaeological survey was to evaluate the National Register eligibility of the site and to assess effects of the project on them. The work was completed as part of the Local Capital Project Delivery Program administered by the North Jersey Transportation Planning Authority.

Galloway Road Land Development Project, Bensalem Township, Bucks County, PA (Sponsor: Private Developer) Archaeologist/Research Assistant for the Phase I archaeological survey performed in connection with the Galloway Road Land Development Project in Bensalem Township, Bucks County. Participated in the excavation of approximately 150 Shovel Test Pits (STPs) within undisturbed portions of the project area. The ongoing survey is being performed in compliance with Section 106 of the National Historic Preservation Act, as amended.

Judge Nathaniel Foster House, Lower Township, Cape May County, NJ (Sponsor: Township of Lower) Principal Investigator for a Phase IA archaeological survey to assess the archaeological sensitivity of a property containing an eighteenth-century dwelling. The survey was conducted as a supporting document to a New Jersey Historic Trust Historic Site Management Grant application. Areas of archaeological sensitivity were identified and delineated. The report complied with New Jersey Historic Preservation reporting and survey guidelines.

APPENDIX B: SUMMARY OF NATIONAL REGISTER CRITERIA

1. State and National Registers of Historic Places Criteria
2. Criteria of Adverse Effect

1. State and National Registers of Historic Places Criteria

Significant historic properties include districts, structures, objects, or sites that are at least 50 years of age and meet at least one National Register criterion. Criteria used in the evaluation process are specified in the Code of Federal Regulations, Title 36, Part 60, National Register of Historic Places (36 CFR 60.4). To be eligible for inclusion in the National Register of Historic Places, a historic property(s) must possess:

> the quality of significance in American History, architecture, archaeology, engineering, and culture [that] is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and:

a) that are associated with events that have made a significant contribution to the broad patterns of our history, or

b) that are associated with the lives of persons significant in our past, or

c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components lack individual distinction, or

d) that have yielded, or may be likely to yield, information important in prehistory or history (36 CFR 60.4).

There are several criteria considerations. Ordinarily, cemeteries, birthplaces, or graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years shall not be considered eligible for the National Register of Historic Places. However, such properties will qualify if they are integral parts of districts that do meet the criteria or if they fall within the following categories:

a) a religious property deriving primary significance from architectural or artistic distinction or historical importance, or

b) a building or structure removed from its original location but which is significant primarily for architectural value, or which is the surviving structure most importantly associated with a historic person or event, or

c) a birthplace or grave of a historical figure of outstanding importance if there is no other appropriate site or building directly associated with his/her productive life, or

d) a cemetery which derives its primary significance from graves of persons of transcendent importance, from age, from distinctive design features, or from association with historic events, or

e) a reconstructed building when accurately executed in a suitable environment and presented in a dignified manner as part of a restoration master plan, and when no other building or structure with the same association has survived, or

f) a property primarily commemorative in intent if design, age, tradition, or symbolic value has invested it with its own historic significance, or

g) a property achieving significance within the past 50 years if it is of exceptional importance. (36 CFR 60.4)

When conducting National Register evaluations, the physical characteristics and historic significance of the overall property are examined. While a property in its entirety may be considered eligible based on Criteria A, B, C, and/or D, specific data is also required for individual components therein based on date, function, history, and physical characteristics, and other information. Resources that do not relate in a significant way to the overall property may contribute if they independently meet the National Register criteria.

A contributing building, site, structure, or object adds to the historic architectural qualities, historic associations, or archeological values for which a property is significant because a) it was present during the period of significance, and possesses historic integrity reflecting its character at that time or is capable of yielding important information about the period, or b) it independently meets the National Register criteria. A non-contributing building, site, structure, or object does not add to the historic architectural qualities, historic associations, or archeological values for which a property is significant because a) it was not present during the period of significance, b) due to alterations, disturbances, additions, or other changes, it no longer possesses historic integrity reflecting its character at that time or is incapable of yielding important information about the period, or c) it does not independently meet the National Register criteria.

2. Criteria of Adverse Effect

Whenever a historic property may be affected by a proposed undertaking, Federal agency officials must assess whether the project constitutes an adverse effect on the historic property by applying the criteria of adverse effect. According to the Advisory Council on Historic Preservation, the criteria of adverse effect (36 CFR 800.5), is as follows:

> (1) An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that would qualify it for inclusion in the National Register, in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Consideration shall be given to all qualifying characteristics of a historic property, including those that may have been identified subsequent to the original evaluation for the property's eligibility for the National Register. Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or cumulative.
>
> (2) Adverse effects on historic properties include, but are not limited to (36 CFR 800.5(a)(2)):
>
> i) Physical destruction of or damage to all or part of the property;
>
> ii) Alteration of a property, including restoration, rehabilitation, repair, maintenance, stabilization, hazardous material remediation and provision of handicapped access, that is not consistent with the Secretary's Standards for the Treatment of Historic Properties (36 CFR part 68) and applicable guidelines;
>
> iii) Removal of the property from its historic location;
>
> iv) Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;

v) Introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features;

vi) Neglect of a property which causes its deterioration, except where such neglect and deterioration are recognized qualities of a property of religious and cultural significance to an Indian tribe or Native Hawaiian organization; and

vii) Transfer, lease, or sale of property out of Federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance.

A finding of adverse effect or no adverse effect could occur based on the extent of alteration to a historic property, and the proposed treatment measures to mitigate the effects of a proposed undertaking. According to 36 CFR 800.5(3)(b):

> The agency official, in consultation with the SHPO/THPO, may propose a finding of no adverse effect when the undertaking's effects do not meet the criteria of § 800.5(a)(1) or the undertaking is modified or conditions are imposed, such as the subsequent review of plans for rehabilitation by the SHPO/THPO to ensure consistency with the Secretary's Standards for the Treatment of Historic Properties (36 CFR part 68) and applicable guidelines, to avoid adverse effects.

1. Introduction

Harris Miller Miller & Hanson Inc. (HMMH) is assisting DY Consulting Engineers with the Environmental Assessment (EA) for the Air Traffic Control Tower Replacement Project (Proposed Action) at Trenton-Mercer Airport (TTN) in Mercer County, New Jersey. The proposed project consists of demolition of the existing air traffic control tower and asphalt parking area at TTN and constructing a new 11,126-square-foot air traffic control tower, roadway, and parking area.

This technical report provides detailed information for the National Environmental Policy Act (NEPA) air quality, greenhouse gas, and construction noise analyses of the EA, including the methodology and assumptions for the construction and demolition activity for the Proposed Action. The air quality analysis, presented in **Section 2**, includes the evaluation of criteria pollutant emissions from the construction and demolition activities associated with the Proposed Action. The greenhouse analysis, presented in **Section 3**, includes the effect the Proposed Action may have on greenhouse gases and compares those results using global factors. The noise analysis, presented in **Section 4**, presents the effect of temporary construction noise on the local environment during development of the Proposed Action.

2. Air Quality

The air quality analysis includes comparison of the criteria pollutant emissions from the construction and demolition activities for the Proposed Action to United States Environmental Protection Agency (US EPA) *de minimis* thresholds to determine significant impacts under NEPA. The Proposed Action is not anticipated to increase the number of forecast aircraft operations and/or the number of vehicle trips or stationary combustion equipment compared to the No Action Alternative; therefore, additional aircraft and associated ancillary activities were not evaluated in this EA.

2.1 Regulatory Framework

Under NEPA, federal agencies must consider the impact their actions will have on the environment compared to a No Action Alternative. According to Federal Aviation Administration (FAA) NEPA implementing guidance (FAA Order 1050.1F and Desk Reference, and FAA Order 5050.4B), impacts to air quality must be considered as part of the environmental analysis under NEPA. Potential effects of the Proposed Action are evaluated against the National Ambient Air Quality Standards (NAAQS), as promulgated by the US EPA under the federal Clean Air Act (CAA).

2.1.1 National Ambient Air Quality Standards

The US EPA currently regulates six criteria pollutants: ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter (PM), and lead (Pb). PM is divided into two particle size categories: coarse particles with a diameter less than 10 micrometers (PM_{10}) and fine particles with a diameter of less than 2.5 micrometers ($PM_{2.5}$). The NAAQS are expressed in terms of pollutant concentration measured (or averaged) over a defined period of time and are two-tiered. The first tier (the "primary standard") is intended to protect public health; the second tier (the "secondary standard") is intended to protect public welfare and prevent further degradation of the environment. **Table 1** shows the NAAQS primary and secondary standards for the criteria pollutants.

Section 176(c) of the CAA states that federal agencies cannot engage, support, or provide financial assistance for licensing, permitting, or approving any project that could cause or contribute to the severity and/or number of violations of the NAAQS, or could inhibit the expeditious attainment of these standards.

The standards in **Table 1** apply to the concentration of a pollutant in outdoor ambient air. If the air quality in a geographic area is equal to or better than the national standard, the US EPA will typically designate the region as an "attainment area." An area where air quality does not meet the national standard is typically designated by the US EPA as a "nonattainment area." Once the air quality in a nonattainment area improves to the point where it meets the standards and the additional requirements outlined in the CAA, the US EPA can re-designate the area to attainment upon approval of a Maintenance Plan, and these areas are then referred to as "maintenance areas."

Each state is required to prepare a State Implementation Plan (SIP) that outlines measures that regions within the state will implement to attain the applicable air quality standard in nonattainment areas for applicable criteria air pollutant, and to maintain compliance with the applicable air quality standard in maintenance areas. The status and severity of pollutant concentrations in a particular area will impact

the types of measures a state must take to reach attainment with the NAAQS. The US EPA must review and approve each state's SIP to ensure the proposed measures are sufficient to either attain or maintain compliance with the NAAQS within a set period of time.

The CAA Amendments of 1990 require states to make recommendations to the US EPA regarding the attainment status of all areas within their borders when the US EPA finalizes an update to any NAAQS. Under its CAA Amendments authority, the US EPA further classifies nonattainment areas for some pollutants – such as O_3 – based on the severity of the NAAQS violation as marginal, moderate, serious, severe, and extreme. To further improve the nation's air quality, the US EPA lowered the O_3 standard in 2015 to 0.070 parts per million (ppm). Similarly in February 2024, US EPA strengthened the primary annual $PM_{2.5}$ standard to 9 micrograms per cubic meter of air (µg/m^3) from 12 µg/m^3.[1]

Table 1. National Ambient Air Quality Standards

Pollutant	Averaging Time	Primary Standards	Secondary Standards
CO	Eight-Hour	9 ppm	None
	One-hour	35 ppm	None
Pb	Rolling Three-Month Average	0.15 µg/m^3	Same as Primary
NO_2	Annual Arithmetic Mean	0.053 ppm (100 µg/m^3)	Same as Primary
	One-hour	0.100 ppm Note 2	None
O_3	Eight-hour (2015 standard) Note 4	0.070 ppm	Same as Primary
$PM_{2.5}$	Annual Arithmetic Mean	9 µg/m^3 Note 5	15 µg/m^3
	24-hour	35 µg/m^3	Same as Primary
PM_{10}	24-hour	150 µg/m^3 Note 1	Same as Primary
SO_2	One-hour	75 parts per billion (ppb) Note 3	None
	Annual	None	10 ppb Note 6

µg/m^3 = micrograms per cubic meter
ppb = parts per billion
ppm = parts per million

Notes
1. For PM_{10}, the 24-hour standard is not to be exceeded more than once per year on average over three years. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or are less than the standard.
2. To attain this standard, the three-year average of the 98th percentile of the daily maximum one-hour average at each monitor within an area must not exceed 0.100 ppm (effective January 22, 2010).
3. Final rule signed June 2, 2010. To attain this standard, the three-year average of the 99th percentile of the daily maximum one-hour average at each monitor within an area must not exceed 75 ppb.
4. US EPA updated the NAAQS for O_3 to strengthen the primary eight-hour standard to 0.07 ppm on October 1, 2015. An area will meet the standard if the fourth-highest maximum daily eight-hour O_3 concentration per year, averaged over three years is equal to or less than 70 ppb.
5. US EPA strengthened the annual PM2.5 standard to 9 µg/m^3 on February 7, 2024. https://www.epa.gov/newsreleases/epa-finalizes-stronger-standards-harmful-soot-pollution-significantly-increasing.
6. The 2024 rulemaking added a new annual secondary NAAQS in 40 CFR Part 50 without altering the 1971 secondary 3-hour SO2 NAAQS. Note that some areas may have certain continuing implementation obligations.

2.2 Affected Environment

2.2.1 Attainment Status

The US EPA Green Book[2] lists nonattainment, maintenance, and attainment areas across the nation as designated by US EPA. It lists air quality in the TTN area as in attainment for all criteria pollutants except the 2008 and 2015 eight-hour O_3 standard and the 2006 $PM_{2.5}$ standard based on recent air monitoring data collected by the state agency. US EPA classifies the areas into categories based on the severity of nonattainment based on air quality. Specifically, the TTN area is designated as a marginal and moderate nonattainment area for the 2008 and 2015 eight-hour O_3 standard, respectively, and maintenance area for the 2006 $PM_{2.5}$ standard.

2.2.2 General Conformity Rule

The General Conformity Rule defines a federal action as any activity engaged in by a department, agency, or instrumentality of the federal government, or any activity that a department, agency, or instrumentality of the Federal Government supports in any way, provides financial assistance for, licenses, permits, or approves. General Conformity is defined as demonstrating that a project or action conforms to the SIP's purpose of eliminating or reducing the severity and number of violations of the NAAQS and achieving expeditious attainment of such standards. Federally funded and approved actions at airports are subject to the US EPA's General Conformity regulations. The General Conformity Rule[3] applies to all federal actions except for certain highway and transit programs which must instead comply with the Transportation Conformity Plans.[4]

The General Conformity Rule includes annual emissions thresholds for nonattainment and maintenance areas that trigger the need for a General Conformity determination and defines projects that are typically excluded from General Conformity requirements. Since TTN is located in a US EPA-designated nonattainment area for 2008 and 2015 O_3 standards and the 2005 $PM_{2.5}$ standards, the General Conformity requirements apply to this Proposed Action. In addition, the EPA *de minimis* thresholds were used to determine significant impacts under NEPA for those pollutants that are designated attainment with the NAAQS by US EPA in Mercer County.

2.3 Environmental Consequences of the Proposed Action

Potential air quality impacts associated with construction and demolition activity for the Proposed Action are discussed in this section. The Proposed Action would not induce changes in aircraft operations and/or additional vehicle trips or stationary combustion sources compared to the No Action Alternative after construction. Therefore, air emissions associated with aircraft and general access vehicles/stationary sources were not inventoried as part of this analysis.

[2] US EPA Green Book, https://www.epa.gov/green-book.

[3] Revisions to the General Conformity Rule are codified under 40 CFR Parts 51 and 93, Subpart W, Revisions to the General Conformity Regulations, Final Rule (April 2010).

[4] 40 CFR Part 93, Subpart A.

2.3.1 Methodology

This section documents the methods used to calculate emissions of CO, volatile organic compounds (VOCs), oxides of nitrogen (NOx), SO_2, PM_{10}, and $PM_{2.5}$, and greenhouse gases (GHGs) from construction sources associated with the Proposed Action. This analysis develops emissions inventories pursuant to NEPA as well as determining whether emissions associated with the Proposed Action would exceed the applicable US EPA *de minimis* thresholds.

Estimates of construction-related emissions were developed for the Proposed Action using standard industry methodologies and techniques including the FAA Aviation Emissions and Air Quality Handbook Version 4 and associated US EPA guidance, Motor Vehicle Emission Simulator (MOVES5 latest available edition) for both on-road and nonroad source emission factors. These techniques are described in more detail in the following sections. Construction activities associated with the Proposed Action were estimated for the 2027 and 2028 construction years.

2.4 Demolition and Construction Activities

The Proposed Action would consist of demolition of the existing air traffic control tower and asphalt parking area and constructing a new 11,126-square-foot air traffic control tower and roadway and parking area. Additional utility work and new fencing will also be constructed. Construction emissions were not estimated for the No Action Alternative, because no construction activity would be associated with the No Action Alternative. The construction associated with the Proposed Action would result in short-term changes in air emissions from sources such as exhaust from nonroad construction equipment such as:

- Demolition
- Milling and paving, and
- Excavation and grading.

On-road vehicles include those associated with:

- Transport and delivery of supplies,
- Materials and equipment to and from the site, and
- Construction worker trips.

Additionally, fugitive dust emissions sources include:

- Site preparation and excavation,
- Equipment movement on unpaved and paved roads, and
- Evaporative emissions from the application of asphalt paving.

Construction activities associated with the Proposed Action are expected to begin in July 2027 and be completed in December 2028.

Table 2 presents the primary components of the Proposed Action including area estimates, preliminary costs, and anticipated start and end dates of construction. These estimates were used for deriving

construction equipment schedules with the Airport Cooperative Research Board's (ACRP) Airport Construction Emissions Inventory Tool (ACEIT).[5]

Table 2. Proposed Action Construction Activities

Project Action Component	Square Feet	Estimated Costs	Construction Start	Construction End
Demolition of Existing Air Traffic Control Tower	5,405	$200,000	December 2028	December 2028
Demolition of existing parking area	13,500	$100,000	December 2028	December 2028
Construction of New Air Traffic Control Tower	11,126	$9,200,000	July 2027	May 2028
Construction of New Parking Area Construction of New Roadway	39,000	$408,319	April 2028	May 2028
Utility Work	12,430 linear feet	$2,425,350	July 2027	September 2027
New Fencing	700 linear feet	$80,500	May 2028	June 2028

Source: DY Consultants, June 19, 2024 email along with preliminary project costs.

The ACRP ACEIT model[6] was used to estimate the construction *schedule of equipment only* for each project component based on the project dimensions and project costs for each activity consistent with the latest FAA Handbook Version 4 guidance.[7] The model has the ability to generate construction schedules (i.e., equipment type and hours) for a variety of standard airport construction projects including the associated activity types and the equipment used for this project.

[5] ACRP, 2014 https://crp.trb.org/acrp0267/acrp-report-102-guidance-for-estimating-airport-construction-emissions/

[6] ACRP, Guidance for Estimating Airport Construction Emissions, http://onlinepubs.trb.org/onlinepubs/acrp/docs/ACRP02-33_FR.pdf.

[7] Section 5.2.1
https://www.faa.gov/regulations_policies/policy_guidance/envir_policy/airquality_handbook/files/airquality_handbook_version_4.pdf

ACEIT can also produce emission factors for nonroad and on-road construction equipment, as well as for fugitive emission sources using US EPA and industry standard models and methodologies. However, the current version of ACEIT includes an older version of the US EPA's MOVES emission model, MOVES2010a and NONROADs, which have both been updated over the years. Consistent with the recent FAA Handbook Version 4, emission factors were generated outside of ACEIT using the current version of MOVES5 to develop on-road and nonroad emission factors for Mercer County.[8] These emission factors were applied to estimates of vehicle miles traveled (VMT) and construction equipment (hours, horsepower, load factor), respectively, for each construction activity and year. It should be noted that the original construction schedule assumed that construction would occur in 2026 and 2027, and emission factors were generated using MOVES for those construction years. The construction schedule has since been revised to occur in 2027 and 2028. However, using the 2026 and 2027 emission factors to represent construction emissions in 2027 and 2028 is not expected to significantly affect the results or conclusions. In fact, emission factors are expected to be slightly lower in 2027 and 2028 due to continued modernization of the vehicle fleet and the adoption of cleaner fuels mandated by state and federal regulations. Therefore, as a conservative assumption, the 2026 and 2027 MOVES emission factors were used to represent construction emissions for the 2027 and 2028 construction years. Spreadsheet calculations for construction are presented in **Appendix A**.

2.4.1 Nonroad Construction Equipment

As discussed above, nonroad equipment emission factors for each construction year using the MOVES5 emission model which incorporates county level data representative of Mercer County for both criteria pollutants/precursors and greenhouse gases. Emission factors in grams per horsepower (hp-hr) for each nonroad equipment type were applied to the equipment size (in hp), load factor, and anticipated activity levels (in hours per year) of expected equipment use, as generated in the construction equipment inventory by ACEIT.

The annual emissions for nonroad construction equipment were computed using the following equation:

Nonroad Vehicle Construction emissions (tons per year) = emission factor (grams per hp-hr) x size (hp) x load factor x hours per year x (1 pound/453.6 grams) x (1 ton/2,000 pounds)

2.4.2 On-Road Construction Passenger/Truck Delivery Vehicles

VMT data for each on-road employee trip and truck delivery vehicles were derived from round trip distances and the number of employee hours from the activity-specific construction schedule in ACEIT. It is assumed that all on-road equipment would use gasoline for passenger vehicles and diesel fuel for truck deliveries. Emission factors in grams per mile (g/mile) for each on-road vehicle type were applied to the anticipated VMT. Similar to the way emissions are estimated for nonroad equipment, the MOVES5 model uses US EPA vehicle default data representative of Mercer County for both criteria pollutants/precursors and greenhouse gases to estimate emissions factors in g/mile. A round-trip distance of 30 miles was assumed for employee trips, and 40 miles was assumed for material delivery trips.

[8] Construction emissions used in MOVES5 NONROAD assumed a blend of Tier 1, Tier 2, Tier 3, and Tier 4 for Mercer County based on US EPA phasing ratios of older equipment in future years and does not reflect the primary use of either Tier 1 thru Tier 4 engines. MOVES emission factors are specific to Mercer County as generated within MOVES for each year.

The annual emissions for on-road passenger/delivery vehicles were computed for each year using the following equation:

On-road construction vehicles emissions (tons per year) = emission factor (g/mile) x annual VMT x (1 pound/453.6 grams) x (1 ton/2,000 pounds)

2.4.3 Fugitive Dust Emissions

Fugitive dust emissions from site preparation and land clearing, equipment movement on unpaved and paved areas, along with evaporative emissions from asphalt paving activities were estimated using US EPA emission factors and methodologies. These are all included in the total construction emissions.

2.5 Summary of Construction-Related Emissions

Construction-related emissions of criteria pollutants during the 2027 and 2028 construction period under the Proposed Action using the methodology discussed above are summarized in **Table 3**. Pb emissions are included and are expected to be zero as fuel for the construction and vehicles is expected to be ultra-low diesel fuel and gasoline, neither of which contain lead. The air emissions spreadsheets are included in **Appendix A**.

Table 3. Construction Emission Inventory – Proposed Action

Construction Year	Activity	Relevant Criteria Pollutant Emissions (tons per year)[Note2]						
		CO	VOC [Note 1]	NOx [Note 1]	SO_2	PM_{10}	$PM_{2.5}$	Pb
2027	NonRoad	0.211	0.029	0.695	0.002	0.037	0.036	0
	Onroad	1.338	0.044	0.063	0.001	0.016	0.005	0
	Fugitives	0.000	0.000	0.000	0.000	0.066	0	0
	Total	**1.55**	**0.07**	**0.76**	**0.003**	**0.12**	**0.04**	**0**
2028	NonRoad	0.496	0.097	1.569	0.008	0.102	0.099	0
	Onroad	0.655	0.024	0.072	0.001	0.012	0.004	0
	Fugitives	0.094	1.821	0.006	0.001	0.153	0	0
	Total	**1.25**	**1.94**	**1.65**	**0.01**	**0.27**	**0.10**	**0**

Notes:

1. Following standard industry practice, O_3 was evaluated by evaluating emissions of VOC and NOx, which are precursors in the formation of O_3.
2. As noted, as a conservative assumption, MOVES5 emission factors for 2026 and 2027 were used to determine emissions for 2027 and 2028 construction years.

Source: HMMH, 2025 and information provided by DY Consultants

2.5.1 Significance Thresholds

As provided in FAA Order 1050.1F, an action would cause a significant air quality impact if pollutant concentrations would exceed one or more of the NAAQS established by the US EPA under the CAA, for any of the time periods analyzed, or would increase the frequency or severity of any such existing violations. Additionally, the CAA requires federal agencies such as the FAA to ensure their actions conform to the appropriate SIP. Conformity requires that a project or action adheres to the SIP's purpose of eliminating or reducing the severity and number of violations of the NAAQS and achieving expeditious attainment of such standards.

The General Conformity Rule applies to this project since the project area is designated marginal nonattainment with the 2008 and 2015 O_3 standards and maintenance for $PM_{2.5}$. If General Conformity applies, an applicability analysis is performed to determine if a General Conformity Determination is required to demonstrate that the Proposed Action conforms to the approved SIP(s).

A conformity determination is required if the total direct and indirect pollutant emissions resulting from a project are above the *de minimis* emissions threshold levels specified in the conformity regulations. The *de minimis* thresholds represent emission quantities of a NAAQS-regulated pollutant or its applicable precursors over which a proposed action in a nonattainment or maintenance area may cause or contribute to a new or continued violation of the NAAQS.

A conformity determination is not required if the differences in emissions between the Proposed Action and the No Action Alternative are below the applicable *de minimis* emission threshold levels, or if the Proposed Action is exempt or included in the FAA list of "presumed to conform activities." It should be noted the proposed project would fall under the FAA Presumed to Conform list under Project Category 15, Routine Installation and Operation of Airport Navigational Aids which covers "The routine installation, in-kind replacement, and maintenance of navigational aids (e.g., Air Traffic Control Towers (ATCT), Instrument Landing Systems (ILS), Approach Light Systems (ALS)) are presumed to conform because these activities will not generate emissions that exceed de minimis levels"[9]. For transparency under NEPA and as a conservative approach, the construction emissions associated with the ATCT under the FAA presumed to conform were included in the construction summary **Table 5** for comparison to appropriate *de minimis* thresholds.

Federal *de minimis* emission thresholds for nonattainment and maintenance areas relevant to TTN are listed in **Table 4**. As noted in the table, pollutants designated as attainment do not have US EPA *de minimis* thresholds, therefore as a conservative assumption, the maintenance *de minimis* thresholds were used to determine significant impacts under NEPA for attainment pollutants.

Table 4. General Conformity US EPA De minimis Pollutant Emissions Thresholds

Pollutants	Attainment Status (Severity)	Pollutants	*De Minimis* Threshold (tons per year)
O_3 Note 1	Non-attainment Marginal (2008 Standard), Moderate (2015 Standard)	Nitrogen Oxides (NOx)	100
		Volatile Organic Compounds (VOC)	50
CO Note 2	Attainment	CO	100
$PM_{2.5}$	Maintenance (2006 Standard)	PM2.5	100
PM_{10} Note2	Attainment	PM10	100
SO_2 Note2	Attainment	SO2	100
Pb Note2	Attainment	Pb	25

Notes

1. Following standard industry practice, ozone was evaluated by evaluating emissions of VOC and NOx, which are precursors in the formation of ozone.
2. Pollutants designated as attainment, no *de minimis* threshold exists for attainment pollutants. As a conservative approach, the de minimis threshold for maintenance was assumed to determine significant impacts under NEPA.

Source: EPA, https://www.epa.gov/general-conformity/de-minimis-table, Accessed on September, 2026.

[9] 72 Federal Register 41565

2.5.2 Construction Emissions Impacts Compared to Significance Levels

Construction-related emissions of criteria pollutants during the construction period (2027 and 2028) under the Proposed Action are summarized in **Table 5** and compared with the appropriate US EPA *de minimis* thresholds. As noted above, the project falls under the FAA Presumed to Conform activities and emissions will not exceed *de minimis* thresholds, therefore, a General Conformity determination is not required for the construction and demolition activities for the Proposed Action. Additionally, in accordance with the FAA 1050.1 Desk Reference,[10] the Proposed Action can be determined to "not cause a significant air quality impact, since it is unlikely the pollutant concentration analyzed would exceed a NAAQS." No significant adverse air quality impacts would be expected to result from construction of the Proposed Action. Similarly the emissions in **Table 5** shows, the total emissions for on-road, nonroad, and fugitive sources for the 2027 and 2028 construction years would be below established *de minimis* thresholds for all pollutants.

Table 5. Total Construction Emissions Compared to *de minimis* Thresholds

Construction Year	Relevant Criteria Pollutant Emissions (tons per year)						
	VOC[3]	NOx[3]	PM2.5	CO[1]	SO2[1]	PM10[1]	Lead[1,2]
2027	0.07	0.76	0.04	1.55	0.003	0.12	0
2028	1.94	1.65	0.10	1.25	0.01	0.27	0
Peak Annual Emissions	**1.94**	**1.65**	**0.10**	**1.25**	**0.01**	**0.27**	**0**
US EPA *de minimis* Threshold	50	100	100	100	100	100	25
Emissions below* de minimis *thresholds?	***Yes***	***Yes***	***Yes***	***Yes***	***Yes***	***Yes***	***Yes***

Notes

1. Since pollutants are designated attainment by US EPA, no *de minimis* thresholds exist. The maintenance area designation *de minimis* thresholds were used to determine significance under NEPA.
2. Pb emissions for construction emissions were not estimated since the fuel use for these sources is gasoline and diesel which do not contain lead.
3. Following standard industry practice, ozone was evaluated by evaluating emissions of VOC and NOx, which are precursors in the formation of ozone.
4. As noted, as a conservative assumption, MOVES5 emission factors for 2026 and 2027 were used to determine emissions for 2027 and 2028 construction years.

Source: HMMH, September 2026

The No Action Alternative assumes that the Proposed Action is not implemented, and air quality would remain unchanged for 2027 and 2028. Therefore, no additional air quality impacts would occur as a result of choosing the No Action Alternative.

2.5.3 Mitigation

As indicated in **Section 2.5.2**, air quality impacts associated with construction of the Proposed Action would not be significant; therefore, no mitigation measures are required for construction emissions. However, the airport is committed to Best Management Practices (BMPs) to mitigate construction

[10] https://www.faa.gov/about/office_org/headquarters_offices/apl/environ_policy_guidance/policy/faa_nepa_order/desk_ref

impacts which could include dust suppression, maintaining construction vehicles, limiting engine idling, etc.

3. Greenhouse Gas Emissions

GHG emissions result from anthropogenic sources, including the combustion of fossil fuels. GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), O_3, and fluorinated gases.[12] CO_2 is the most important anthropogenic GHG because it is a long-lived gas that remains in the atmosphere for up to 100 years. Anthropogenic sources of GHG emissions include the combustion of fossil fuels.

3.1 Regulatory Framework

Research has shown that there is a direct link between fuel combustion and GHG emissions. Therefore, sources that require fuel or power at an airport are the primary sources that would generate GHGs including construction and operational emissions.

While US aviation has seen increased traffic in terms of passengers over the past 30 years, aviation's share of US CO_2 emissions has remained relatively constant. In 2019, civil aviation's share of US CO_2 emissions was about 2.7 percent of total domestic emissions.[13] Aircraft in the national air space are operating much more efficiently, moving more passengers using the same amount of energy. In 2018, the US aviation sector carried about 32 percent more passengers than in the year 2000, while using almost the same amount of fuel (and emissions), due in large part as result of the fuel efficiency improvements of the fleet over time. Today's fleet of aircraft has an average fuel efficiency of 57.5 passenger-miles per gallon of fuel.[14]

There are no formal standards for GHG emissions. Per FAA Order 1050.1F, the discussion of potential greenhouse gas impacts should be documented in a separate section of the NEPA document, distinct from air quality.[15] Where the proposed action or alternative(s) would result in an increase in GHG emissions, the emissions should be assessed either qualitatively or quantitatively. The emissions should be quantified using the methodology and assumptions provided in the FAA Emissions and Air Quality Handbook, Version 4[16] which is the latest guidance released by FAA for assessing GHG emissions for Federal Actions. Where the proposed action or alternative(s) would result in an increase in GHG emissions, the emissions should be assessed. The overall reduction of aviation related GHG emissions is a goal, but it is not a regulatory mandate.

3.2 Affected Environment

The Delaware Valley Regional Planning Commission (DVRPC) performs a regional energy use and GHG emissions inventory every five years. The latest inventory *Energy Use and Greenhouse Gas Emissions Inventory for Greater Philadelphia* was released in November 2018 and provides an overview of energy use and greenhouse gas (GHG) emissions in Greater Philadelphia, including Mercer County[17]. For 2015, Mercer County produced approximately 5 million metric tons (MMT) of CO2 equivalents (CO2e).

[12] US Environmental Protection Agency, Overview of Greenhouse Gases, http://www3.epa.gov/climatechange/ghgemissions/gases.html.

[13] US EPA, "Inventory of U.S. Greenhouse Gas Emissions and Sinks," available at: www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks

[14] ICAO, "United States Efforts to Address Aviation's Climate Impact," A40-WP/531, ICAO 40th General Assembly, Executive Committee, available at: www.icao.int/Meetings/a40/Documents/WP/wp_531_en.pdf.

[15] https://www.faa.gov/sites/faa.gov/files/about/office_org/headquarters_offices/apl/3-climate.pdf.

[16] https://www.faa.gov/regulations_policies/policy_guidance/envir_policy/airquality_handbook

[17] https://www.dvrpc.org/reports/18018.pdf

According to the report, the majority of emissions in the greater Philadelphia area are from large stationary energy sources (28 percent), followed by mobile sources (23.1 percent), residential energy sources (15.4 percent), followed by a combination of industrial processes, fuel refining, waste management and agriculture.

3.3 Analysis Methodology

For this analysis, GHG emissions associated with the Proposed Action were prepared for CO_2, CH_4, and N_2O and presented as CO_2e in metric tons per year relevant to their GWP. The CO_2 equivalent is estimated by taking the mass equivalent of each pollutant (tons per year), multiplying by the GWP equivalent of each pollutant, and then adding them together. For example, CO_2 is 1 GWP, CH_4 is 29.8 GWP, and N_2O is 273 GWP, according to the IPCC Sixth Assessment Report.[18]

In general, FAA's GHG emissions inventory procedures are intended to accomplish the following:

- Identify and characterize the types and sources of GHGs to include in an emissions inventory.
- Apply appropriate and consistent methods for calculating GHG emission inventories.
- Aid in the integration of GHG inventories into larger regional, national, and global inventories.
- Clarify the specific makeup and percent contribution of applicant-generated GHGs, by source and emission type.

3.4 Environmental Consequences of Proposed Action Alternative

Table 6 presents the annual GHG emissions for construction activities associated with the Proposed Action for 2027 and 2028.

In summary, there are no significance thresholds established for GHG impacts and GHGs associated with the Proposed Action have been calculated in accordance with the latest FAA guidelines (1050.1F) in a NEPA document[19, 20] and included in the emission spreadsheets in **Appendix A**.

Increases in construction emissions compared to the No Action Alternative would be temporary on the construction side, but necessary for the proposed improvements at TTN. However, the increases would comprise a small portion of the state of Mercer County 2015 GHG emissions 5 $MMTCO_2e$, the US-based emissions of 6,348 $MMTCO_2e$, and even less than the 49 gigatons of carbon dioxide equivalent global GHG emissions.[21,22,23] Based on all this information and given the low percentage of overall emissions generated by the Proposed Action, the increase in construction and/or Proposed Action emissions would not be substantial on a state, national or global scale.

Table 6. GHG Emissions Associated with Construction for the Proposed Action

Year	Greenhouse Gases (metric tons/year)			CO_2e (metric tons/year) [Notes 2, 3]
	CO_2	CH_4	N_2O	
Construction [Note 1]				
2027	775	0.002	0.004	776
2028	2,916	0.002	0.004	2,917

Notes:
1. Construction emissions derived from ACEIT and MOVES consistent with FAA Emission Handbook Version 4.
2. GWP values derived from IPCC Sixth Assessment Report were used in the calculations of CO_2e.
3. Emissions presented in the table include the GWP for each pollutant.
4. As noted, as a conservative assumption, MOVES5 emission factors for 2026 and 2027 were used to determine emissions for 2027 and 2028 construction years.

Source: HMMH, 2026

3.5 Mitigation Measures

The FAA is developing policies for the aviation industry to reduce GHG impacts including the Aviation Action Plan and the Net Zero Sustainable Aviation System including the Aviation Action Plan, Net Zero Sustainable Aviation System as well as a commitment to a sustainable transportation system which includes:

- Increase the Production of Sustainable Aviation Fuels
- Eliminate Aviation Gasoline Lead Emissions by the End of 2030
- Develop New Aircraft and Engine Technologies
- Increase Operations Efficiency; and
- Reduce Airport Emissions and Improve Fuel Efficiency

These are general mitigation measures the FAA is developing for the industry and may not be specific to TTN.

4. Noise

At airports, aircraft noise emissions can adversely impact land use compatibility between an airport and surrounding properties, particularly in the presence of noise-sensitive receptors (residences, places of worship, hospitals, schools, parks, etc.). Noise levels inherent to airports are generally compatible with most industrial, commercial, and agricultural land uses. Through the modeling process, abatement measures can be incorporated into airport development plans to avoid or minimize the impacts. Title 14 CFR Part 150 "Airport Noise Compatibility Planning" and the Aviation Safety and Noise Abatement Act of 1979 established a system under the FAA to quantify noise and determine the exposure of people to noise—which includes noise intensity, duration, frequency, and time of occurrence—and to identify land uses normally compatible with various noise exposures. For the Proposed Action, aircraft operational noise and construction noise are typically assessed.

4.1 Regulatory Framework

Navigable airspace and civil aircraft operations therein are regulated by the FAA. The airports, air traffic communications/navigation/surveillance infrastructure, operating rules, policies, and personnel engaged in air commerce are collectively referred to as the National Airspace System (NAS). Under US law, the FAA (an agency of the US Department of Transportation) is the primary steward of the NAS. Accordingly, civil airports in the United States are designed and operated according to FAA regulations.

The regulations for implementing NEPA (40 CFR 1500-1508) are binding upon all Executive Branch departments and agencies of the Federal Government and direct departments and agencies to issue implementing regulations. In turn, the FAA has adopted agency-wide policy and procedures for compliance with NEPA regulations as FAA Order 1050.1F *Environmental Impacts: Policies and Procedures* and the FAA Office of Airports has similarly issued supplemental implementing regulations, FAA Order 5040.1B *National Environmental Policy Act (NEPA) Implementing Instructions for Airport Actions*.

There are three levels of analysis established for federal actions under NEPA. Initial investigation by the FAA and airport sponsor indicates that the intermediate level of analysis is indicated (an EA) to determine whether significant impacts would occur if the Proposed Action or its alternatives were implemented.

The noise analysis for this EA was conducted in accordance with the guidance and regulations specified above. FAA Order 1050.1F, effective July 16, 2015, and the associated 1050.1F Desk Reference updated in June 2024, specifies a number of requirements for the noise analyses. These include:

- Acceptable noise models to be used and the circumstances under which their use is required.
- The metrics to be used for characterizing the noise environment and quantifying impacts.
- Thresholds of significance for determining whether the effects of an action would constitute a significant impact under NEPA.
- Circumstances indicating that supplemental noise analyses are indicated.

Since aircraft operations at TTN would not be affected by the Proposed Action, this analysis is focused on noise and vibration conditions during the construction of the Proposed Action. The FAA requires the use of the Aviation Environmental Design Tool (AEDT) to identify potential noise impacts; however, AEDT is not capable of analyzing noise that would result from surface transportation and construction

equipment sources. For this reason, AEDT was not used. Noise analysis guidance defined in FAA Order 1050.1F states, "…analysis of surface transportation impacts, including construction noise, should be conducted using accepted methodologies from the appropriate modal administration."[24]

The Federal Highway Administration's Roadway Construction Noise Model (RCNM) was used for predicting on-site construction activities that are proposed for the duration of the project. Construction noise levels for on-site equipment were calculated at noise-sensitive receptors utilizing the RCNM methods as implemented in a spreadsheet model. The predicted construction noise levels were then compared to applicable noise level limits to determine impact significance. The Town of Ewing's Noise Ordinance does not apply to aircraft noise via Chapter 240-3 and includes exemptions listed in the New Jersey Administrative Code (N.J.A.C) 7:29-1.5. However, it does apply to construction and demolition activities during nighttime hours unless the activity can be shown to meet the criteria, or a waiver has been obtained to allow overnight activities.

4.2 Aircraft Operational Noise

As described in the purpose and need section, the Proposed Action is not anticipated to change aircraft operations, nor does it include any changes to runway lengths, runway alignments, instrument procedures, navigational equipment, or other factors that affect airfield capacity; therefore, no evaluation of aircraft related noise is required for this analysis.

4.3 Construction Noise

Construction of the Proposed Action was evaluated for the potential to temporarily increase nearby noise levels. An increase in noise levels from construction activities has the potential to adversely affect noise-sensitive land uses such as residential and transient lodging around the study area.

4.3.1 Affected Environment

Construction of the Proposed Action would result in temporary elevated noise levels at nearby noise-sensitive receptors related to heavy vehicles hauling materials and debris to and from the work site and on-site construction activities. Increases in existing noise levels due to construction activities have the potential to adversely affect noise sensitive land uses such as residential and transient lodging around the Project. Noise-sensitive receptors can be located indoors or outdoors and include but are not limited to schools, places of worship, libraries, health care facilities, historical facilities and parks.

Noise-sensitive land uses and receptors were identified in the immediate vicinity of the study area, near the existing and future air traffic control tower and AFLV areas, and include single- and multi-family residences, institutional facilities, recreational facilities, a cemetery, and two hotels. The nearest noise-sensitive land use to proposed work near the existing air traffic control tower and AFLV areas is the Greene 750 apartment complex, located directly west of the Airport. Residences in the complex are located 1,580 feet from the existing air traffic control tower, AFLV, and parking areas and will have direct line of site to construction activities. Noise-sensitive land uses are also located east of the Airport, near the work area where the new replacement air traffic control tower and AFLV will be constructed. The closest residential receptor land use is located approximately 1,500 feet southeast of the work area and includes residences within the Scotch Road apartment complex. Additionally, Veterans Park is

[24] US Department of Transportation, Federal Aviation Administration, Order 1050.1F, *Environmental Impacts: Policies and Procedures*, effective July 16, 2016.

located within 1,200 feet northeast of the air traffic control tower and AFLV work area. The closest residential land uses are located to the south and east of the Proposed Action, respectively.

4.4 Environmental Consequences of the Proposed Action

The following subsections provide the noise and vibration methodology for assessing construction impacts from the Proposed Action. As noted within, no changes in airport operations are evaluated as part of this analysis.

4.4.1 Construction Noise

Noise effects from on-site construction were evaluated by determining the noise levels generated by different types of construction activity and calculating the construction-related noise level at the closest noise-sensitive receptor locations. Construction noise levels can vary depending on equipment type, condition of the equipment, and the type of work the equipment is doing. Annoyance due to construction noise is variable and can result from the use of specific equipment, such as impact pile driving, pavement breakers, as well as mobile equipment working on site and engines idling for extended periods of time.

Construction noise levels were evaluated for on-site construction activities and assumed equipment as discussed within Section 2.4. As per the FAA Order 1050.1F desk reference, noise sources other than aircraft departures and arrivals should be conducted using accepted methodologies from the appropriate modal administration. The Federal Highway Administration's Roadway Construction Noise Model (RCNM) is recognized as an acceptable method for predicting on-site construction activities. Construction noise levels for on-site equipment were calculated using RCNM source levels and methods as implemented in a spreadsheet model. The predicted construction noise levels were then compared to applicable noise level limits to determine impact significance. **Table 8** lists the construction equipment that was modeled for use in the Proposed Action, the RCNM2.0-equivalent equipment type, and the average maximum sound level (Lmax) in A-weighted decibels (dBA) at 50 feet.

Table 7. FHWA Modeled Construction Equipment

FHWA RCNM Equipment	Source Level (Average Lmax @ 50 feet)
Asphalt Distributor Truck (Asphalt Sprayer)	70
Auger Drill	101
Backhoe	84
Compactor (Roller)	82
Compressor	67

Paving - Concrete (Placer + Slipform Paver)	91
Pickup Truck	75
Power Tools - Chainsaw	83
Pump	74
Rumble Strip Grinding	87
Scraper	92
Telescopic Handler (Forklift)	88
Ventilation Fan	63
Water Spray Truck	72

4.4.2 Construction Vibration

The FAA does not provide guidance on assessing construction vibration. Therefore, potential vibration impacts from construction were assessed using the methodology contained in Section 7.2 of the Federal Transit Administration (FTA) Noise and Vibration Impact Assessment Manual (FTA 2018). Vibration source levels for a variety of typical construction equipment types are outlined in Table 7-4 of the FTA manual (reproduced in this report as **Table 9**), in terms of Peak Period Velocity (PPV) in inches per second at a reference distance of 25 feet from the source and velocity in decibels (VdB) at 25 feet. The project construction equipment types that would generate the highest vibration levels include vibratory rollers, bulldozers, and auger drilling activities. Other construction equipment, such as cranes and pickup

trucks, would have lower vibration levels; therefore, construction vibration levels are considered conservative for the purposes of the analysis.

Using equations from Section 7.2 of the FTA Manual, separate damage and annoyance assessments were performed at each sensitive property. The FTA calculation method is dependent on equipment vibration source level and distance between the equipment and receptor.

Table 8. Construction Equipment Vibration Source Levels

Equipment	PPV at 25 Feet, in/sec	Approximate LV[1] at 25 Feet
Vibratory Roller	0.21	94
Large Bulldozer	0.089	87
Caisson Drilling (Auger Drill)	0.089	87

Notes:
PPV – peak particle velocity
1. RMS Velocity in decibels, VDB RE 1 micro-in/sec
Source: U.S. Department of Transportation, Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018

4.5 Thresholds of Significance

4.5.1 Construction Noise

The FAA does not provide significance thresholds for construction noise and therefore, state and local ordinances were used to identify potential construction noise impacts.

Noise control and abatement within the State of New Jersey is regulated by the New Jersey Department of Environmental Protection (NJDEP) within Title 7, Chapter 29 of the New Jersey Administrative Code (N.J.A.C 7:29). N.J.A.C 7:29 does not regulate noise from construction activities; however, provisions within N.J.A.C 7:29 allow local municipalities to adopt a noise ordinance that is at a minimum consistent with N.J.A.C 7:29 but can be more stringent.

The Proposed Action is located within Ewing Township and is subject to the Township's Noise Control Ordinance, which has been reviewed and approved by NJDEP. The Township has adopted exterior sound level limits for receiving land uses consistent with N.J.A.C 7:29 and are summarized below:

- For residential property, or residential portion of a multi-use property, a sound source or sources cannot equal or exceed a maximum sound level of 65 dBA between the hours of 7 AM and 10 PM.
- For residential property, or residential portion of a multi-use property, a sound source or sources cannot equal or exceed a maximum sound level of 50 dBA between the hours of 10 PM and 7 AM.
- For a commercial facility, public service facility, non-residential portion of a multi-use property, or community service facility, a sound source or sources cannot exceed a maximum sound level of 65 dBA at any time.

In addition to the limits set forth above, the Township's Noise Control Ordinance also regulates impulsive sound. These limits would generally apply where noise produced by a source is typically intermittent in nature. As per the ordinance, impulsive sound occurring between 7 AM and 10 PM cannot equal or exceed 80 decibels. Impulsive sound which occurs less than four times in any hour between 10 PM and 7 AM cannot equal or exceed 80 decibels. Any impulsive sound that repeats four or

more times in any hour shall be measured as continuous sound and meet the noise level limits in the bulleted list above.

According to the ordinance, construction noise within the Township of Ewing is exempt during weekdays between 7 AM and 6 PM and on weekends and federal holidays between 9 AM and 6 PM. Construction activities are not permitted outside of these time periods unless such activities can meet the applicable sound level limits summarized above.

4.5.2 Construction Vibration

FTA construction vibration impact criteria was used to identify potential vibration impacts from construction activities. As detailed within the FTA Manual, construction vibration is evaluated for structural damage to buildings as well as the potential for annoyance. Construction activities that have the potential to cause vibration impacts include but are not limited to pile driving, blasting, and caisson drilling. As shown in **Table 10**, construction vibration impact criteria are based on the PPV in inches per second (in/sec) and are separated by building category. An annoyance assessment for construction-induced vibration was also conducted with an impact occurring if a threshold of 80 VdB is exceeded at any use where people sleep and 83 VdB for locations where only daytime use occurs, such as schools.

Table 9. FTA Construction Vibration Damage Criteria

Building Category	PPV (IN/SEC)	Approximate L_V[1]
I. Reinforced-concrete, steel or timber (no plaster)	0.5	102
II. Engineered concrete and masonry (no plaster)	0.3	98
III. Non-engineered timber and masonry buildings	0.2	94
IV. Buildings extremely susceptible to vibration damage	0.12	90

Notes:
PPV=peak particle velocity

Source: U.S. Department of Transportation, Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, September 2018.

4.6 Construction Impacts

4.6.1 Construction Noise

Construction of the Proposed Action would commence in July 2027 and will be completed by December 2028. Construction activities would result in temporary elevated noise levels from on-site construction equipment, personal vehicles used by construction workers to access the construction parking areas, and delivery/haul trucks used for equipment and material delivery and haul trips along local roads surrounding the work area. Roadways carrying worker vehicles and heavy truck traffic to and from the work area would experience an increase in traffic during certain periods of the day; however, the traffic increases would be temporary in nature and not result in significant impacts to receptors adjacent to these routes.

During typical workdays, construction noise levels would fluctuate and often be lower than these predicted worst-case levels. Additionally, the analysis only takes into account the maximum noise level produced by a single piece of construction equipment and does not include other noise sources that make up the existing noise environment, such as airport operations and traffic noise from surrounding roadways. Due to the influence of these other noise sources, the overall contribution from construction

activities related to the Proposed Action is not anticipated to significantly impact noise sensitive receptors when compared to the existing noise environment. An overview of analysis locations and work areas are depicted in Error! Reference source not found..

Results from the construction noise analysis are presented within Error! Reference source not found.. The loudest noise levels are predicted to occur at receptors closest to the work area and with direct line of site to the construction activities. This analysis conservatively predicts the loudest noise levels that can be expected using the shortest distance between receptors and construction activities.

Construction activities are expected to occur during regular daytime working hours. Since the Township of Ewing exempts construction noise from 7 AM to 6 PM on weekdays and from 9 AM to 6 PM on weekends and holidays, no significant impacts would occur. However, if construction should be required during non-exempt hours at any point over the duration of the project, construction activities would be subject to the sound level limits within the Township's ordinance.

The loudest construction noise levels predicted are associated with activities that involve the use of an auger drill, scrapers, dump trucks, and concrete paving equipment. Elevated noise levels at sensitive receptors can be expected for various periods of time once work begins and last through the completion of the Proposed Action. The loudest construction noise levels are predicted to occur during the construction of the new air traffic control tower parking area. Noise levels during this phase will be the loudest at residences within the Scotch Run at Ewing community (Receiver R3) as well as in Veteran's Park (Receiver R4) during the construction of the new air traffic control tower parking area. Elevated construction noise levels at these receivers are also anticipated during the construction of the new roadway and installation of new fencing. The full construction noise analysis can be found within **Appendix B**.

Table 10. Range of Predicted Construction Sound Levels (Lmax) by Sensitive Receiver, dBA

Receiver ID	Receiver Description	Predicted Construction Noise Levels by Project Phase, Lmax dBA						
		Construction of New Air Traffic Control Tower	Utility Work	Demolition of Existing Air Traffic Control Tower	Construction of New Parking Area	Demolition of Existing Parking area	Construction of New Roadway	New Fencing

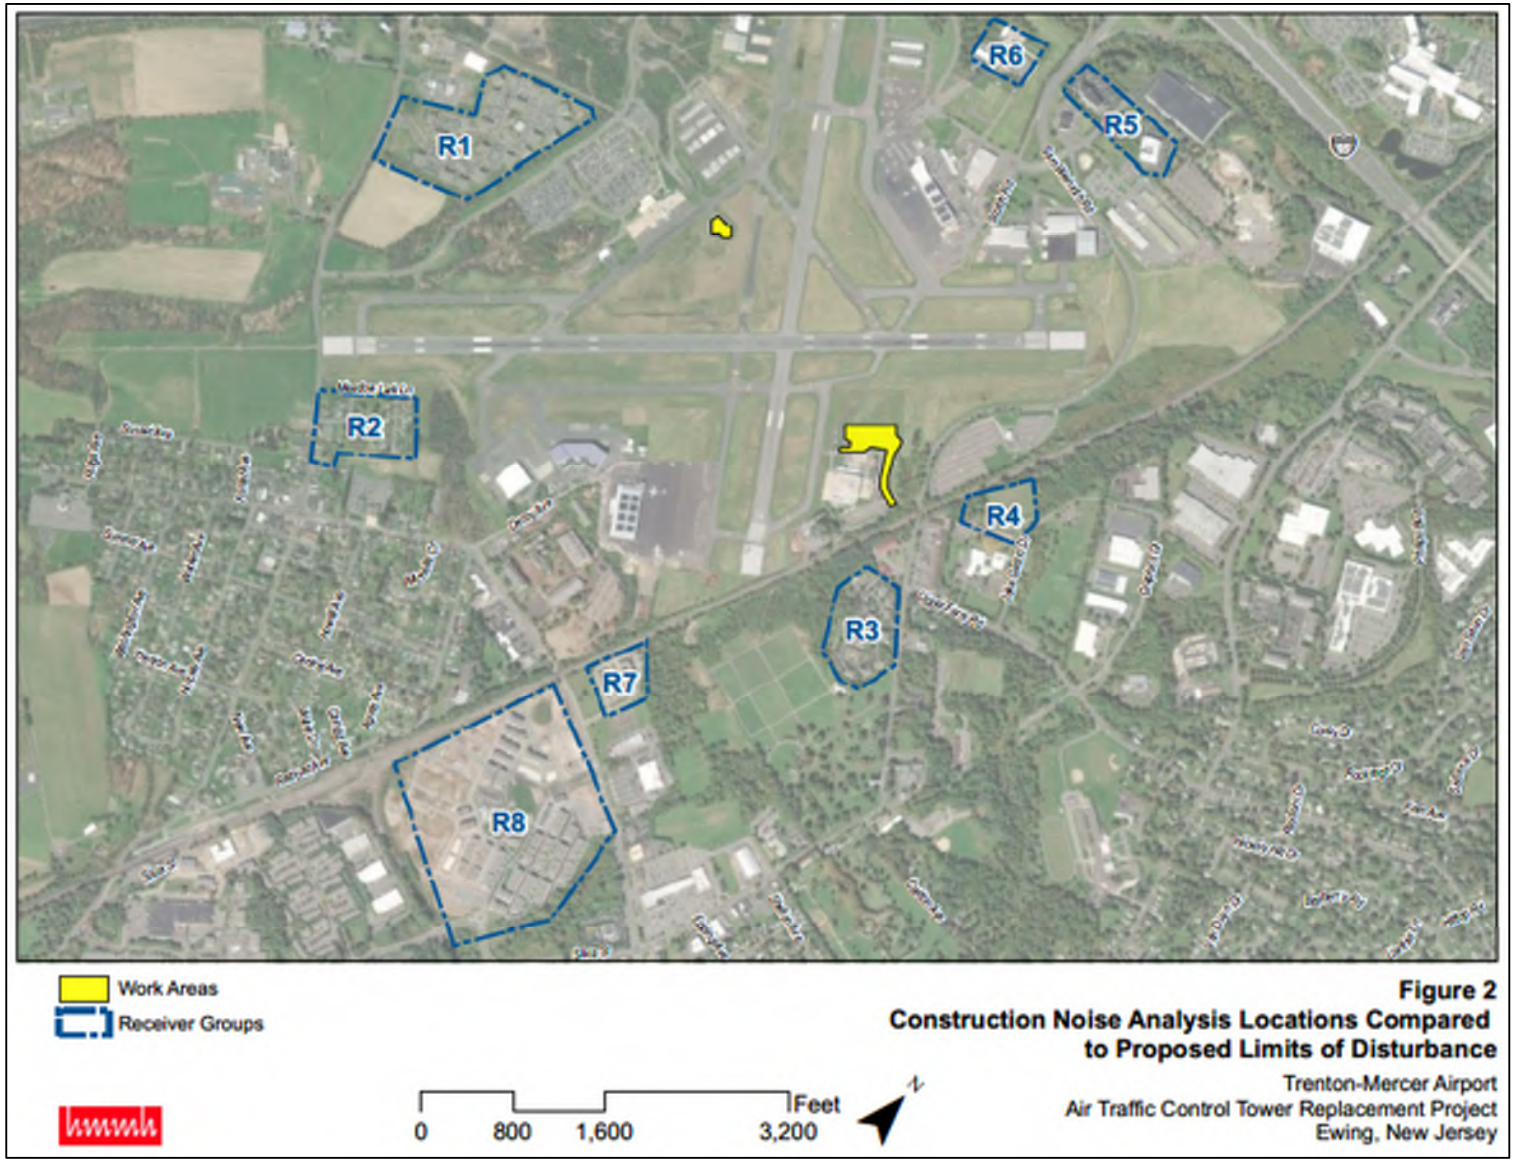
Figure 1. Construction Noise Analysis Locations Compared to Proposed Limits of Disturbance

Source: HMMH, 2024



4.6.2 Construction Vibration

Vibration levels were analyzed at receptors and structures adjacent to the Proposed Action. The vibration analysis conservatively assumes the most vibration-sensitive structures are FTA Category III structures, which are structures made of non-engineered timber and masonry buildings. For vibration annoyance, land use most sensitive to construction vibration includes places where people typically sleep, such as residences.

Vibration-inducing activities occurring during construction include the use of vibratory rollers, auger drills, and bulldozers. The highest vibration levels would result from the use of vibratory rollers when construction of the new parking area and new roadway adjacent to the air traffic control tower occurs. Vibration-induced structural damage to abutting buildings has the potential to occur if vibratory rollers are used within 26 feet of the building structures, which equates to a vibration level of 0.2011 PPV. When construction activities occur further than 26 feet away from structures, no structural damage is predicted. The nearest existing structure to the Proposed Action is the existing former Air National Guard Hanger on airport property, just south of the proposed air traffic control tower. This structure is approximately 126 feet away from the nearest area of work and therefore, structural damage is not predicted to occur as a result of construction vibration. There are no off-airport buildings close to the construction areas; therefore, no vibration impacts are expected to off airport buildings.

Vibration annoyance predictions were calculated at each receptor nearest Proposed Action. For an annoyance impact to occur, a vibratory roller would need to be used within 28 feet of a residence or institutional (schools, libraries, places of worship) land uses. Should these activities occur within this distance, there is a potential for vibration annoyance at residences. However, based on the site plan of the Proposed Action, no construction activity within 28 feet would occur and therefore, vibration annoyance is not predicted. Construction vibration calculations can be found within **Appendix C.**

4.7 Mitigation Measures

Stationary noise sources associated with on-site construction activity have the potential to cause annoyance to the surrounding community and exceed allowable sound level limits by the Township. To minimize and reduce project construction noise, noise mitigation should be implemented where practical. Construction noise mitigation strategies may include, but are not limited to:

- Providing appropriate manufacturer's noise reduction devices, including, but not limited to a manufacturer's muffler (or equivalently rated material) that is free of rust, holes, and exhaust leaks on construction equipment operating on site.
- Mitigating portable noise from construction devices with internal combustion engines by ensuring that the engine's housing doors are kept closed on construction devices with internal combustion engines.
- Covering equipment, such as compressors, generators, pumps and other such devices with noise-insulating fabric as well as operating the device at lower engine speeds during work to the maximum extent possible.
- Using operational controls such as limiting vehicle engine idling onsite and time-of-day restrictions for certain activities, such as a restriction on nighttime pile driving.
- Using quieter or ambient-sensitive back-up alarms on construction equipment whenever practical.

- Strategically positioning construction vehicles as to minimize operation near receptors and directing construction haul vehicles away from receptors when traveling to and from the work site
- Using noise pathway controls, including noise barriers and enclosures free from gaps and holes should be placed as close as possible to construction areas.
- Developing and submitting a Noise Control Plan on a regular basis (e.g. every six months) that includes prediction of construction noise at sensitive locations based on the equipment and activities that will be used over the period of interest. If construction activities are expected to exceed applicable limits, the plan will identify the mitigation measures that will be incorporated into the activities and the amount of noise reduction achieved.
- Using public information procedures to keep the public informed about construction activities and efforts to minimize noise in the community.
- Using complaint response procedures for prompt response and corrective action to noise complaints during construction.

SECTION 1.0 EXECUTIVE SUMMARY

Environmental Connection, Inc., (EC) was contracted by DY Consultants to perform a pre-demolition hazardous material assessment of the Air Traffic Control Tower located at the Trenton-Mercer Airport in West Trenton, New Jersey. The goal of the assessment was to identify Asbestos Containing Materials (ACMs), Lead-Based Paint (LBP) and Universal Waste prior to demolition. The assessment was performed on July 13 and 25, 2023, by a team of EC's United States Environmental Protection Agency (USEPA) accredited Asbestos Building Inspectors and State of New Jersey, Department of Health licensed Lead Based Paint Inspectors.

During the inspection, EC collected approximately 97 samples of 44 suspect asbestos containing materials. Eight (8) of the materials sampled contained asbestos in concentrations greater than 1% by weight and therefore meet the USEPA classification for asbestos containing materials. Four (4) materials were inaccessible for sampling without damaging the building envelope, fire protection systems or mechanical systems, and were therefore assumed to be asbestos containing. The analytical data, and sampling Chain of Custody are attached in Appendix I.

Lead Based Paint was detected on various building components with an X-Ray Fluorescence (XRF) instrument. Components coated with lead based paint included Exterior Metal Walls, Exterior Metal Door Frames and Metal Stair Railings. The Lead Based Paint Inspection Data Sheets are included in Appendix II.

A comprehensive inventory of hazardous universal waste building materials was also compiled as part of the assessment. The inventory is included in Section 4.0. of this report.

The following sections detail the findings of our environmental assessment.

SECTION 2.0 ASBESTOS CONTAINING MATERIAL INSPECTION

Asbestos is a naturally occurring mineral categorized into two (2) groups, Serpentine and Amphibole. It was utilized in more than 3,600 products for its fire resistance, tensile strength, inertness, and chemical binding properties. The Serpentine group is comprised of Chrysotile asbestos, while the Amphibole group consists of Amosite, Crocidolite, Tremolite, Anthophyllite, and other forms of asbestos.

The inspection for asbestos containing materials was performed in accordance with 40 CFR, Part 763, AHERA/ASHARA, and encompassed accessible interior and exterior spaces. Samples of suspect materials were collected in sufficient quantity as mandated by 40 CFR, Part 763.87(a). The samples were submitted to EMSL Analytical, Inc., located in Piscataway, New Jersey. EMSL Analytical, Inc., is accredited by the American Industrial Hygiene Association (AIHA) and participates in the National Voluntary Laboratory Accreditation Program (NVLAP). Samples were analyzed utilizing Polarized Light Microscopy (PLM) via EPA Method 600/R-93/116.

Emergency Regulatory Adoptions to New Jersey Administrative Codes (N.J.A.C.) 8:60 and 12:120, Volume 38, Issue 11, dated June 5, 2006, mandate that non-friable organically bound (NOB) suspect asbestos containing materials be analyzed via Transmission Electron Microscopy (TEM) analysis when

DRAFT

PLM analysis yields results of less than 1% asbestos by weight or "None Detected" for asbestos fibers. TEM uses electron imaging to identify asbestos fibers at a higher magnification.

Analytical results for PLM and TEM analysis methods are reported in percentage by weight. According to the USEPA, materials containing greater than 1% asbestos content by weight are classified as asbestos containing materials. Materials containing <1% asbestos content by weight are classified as "Trace" asbestos containing materials. Trace asbestos containing materials are not regulated by the USEPA or State of New Jersey, but are regulated by the United States Department of Labor Occupational Safety and Health Administration (OSHA). The following tables summarize the analytical results for each building.

Table 1 – Asbestos Analytical Results Summary
Air Traffic Control Tower
Trenton-Mercer Airport
West Trenton, NJ

ID #	Material	PLM Results	TEM Results
01	**Exterior Cement Board Window Panels**	**6% Chrysotile**	**N/A**
02	**Black Window Caulk**	**5% Chrysotile**	N/A
03	Black Door Caulk	None Detected	None Detected
04	**Fibrous Wall Insulation**	**2% Chrysotile**	**N/A**
05	Black Putty at Electrical Penetrations	None Detected	None Detected

| N/A – Not Applicable

The location and approximate total quantities of asbestos containing materials are included in Table 2 below.

Table 2 – Quantity of Identified Asbestos Containing Materials Air Traffic Control Tower Trenton-Mercer Airport West Trenton, NJ		
Material	**Location**	**Quantity**
Cement Board Window Panels	Exterior	250 SF
	Total	**250 SF**
Black Window Caulk	Exterior	660 LF
	Total	**660 LF**
Fibrous Wall Insulation	Cavity Between Exterior and Interior Walls	8,000 SF
	Total	**8,000 SF**
9" x 9" Green and Black Floor Tile	2nd Floor	725 SF
	3rd Floor	775 SF
	4th Floor	335 SF
	5th Floor	400 SF
	6th Floor, under Fixed Furniture and Plywood, and Stairs	500 SF
	Total	**2,735 SF**
Insulated Fire Doors	Throughout	30 Each
	Total	**30 Each**

Table 2 – Quantity of Identified Asbestos Containing Materials Air Traffic Control Tower Trenton-Mercer Airport West Trenton, NJ		
Material	**Location**	**Quantity**
White Duct Vibration Joint Cloth	5th Floor Mechanical Room and Foyer to Cab	14 SF
	Total	**14 SF**
Corrugated Paper Pipe Insulation	Vertical Chase	400 LF
	Assumed in Hidden Chases	400 LF
	Total	**800 LF**
Mudded Fitting Insulation to Corrugated Paper Pipe Insulation	Vertical Chase	100 LF
	Assumed in Hidden Chases	100 LF
	Total	**200 LF**
White Cementitious Window Glazing	Exterior of Stairwell	120 LF
	Total	**120 LF**
12” x 12” Tan Floor Tile with Red and White Streaks	1st Floor Corridor	90 SF
	Total	**90 SF**
Black Sealant on Interior of Windows	4th Floor	50 LF
	5th Floor	6 LF
	Total	**56 LF**

SECTION 3.0 LEAD BASED PAINT INSPECTION

Lead based paint (LBP) was used extensively before 1960 because it was more durable than other paints available at the time. Due to the potential hazards of lead in paint, especially to children, lead-based paint was banned in 1977.

The United States Department of Housing and Urban Development (HUD) and the USEPA define lead-based paint as a coating which contains greater than 0.5% lead by weight or greater than 1.0 milligram of lead per square centimeter (mg/cm^2). The disturbance or dislocation of lead-based paint or lead containing paint from building materials may cause lead dust to be released into the building`s atmosphere, thereby creating a potential health hazard to workers and/or building occupants. To mitigate health hazards, demolition and other construction related work is regulated by the United States Department of Labor, Occupational Safety and Health Administration, (OSHA). Under OSHA’s regulation, 29 CFR, Part 1926.62, “Lead in Construction Standard”, which defines construction work as work for alteration and/or repair, including demolition or salvage of structures, removal or encapsulation of materials containing lead.

New Jersey Administrative Code (N.J.A.C.) 5:17, defines any film which contains greater than 1.0 milligram of lead per square centimeter (mg/cm^2) as lead-based paint. EC performed the screening to characterize the surfaces and building components within the structures and to determine if any coatings are lead based. EC grouped similar building components with the like paint histories for testing purposes.

EC utilized a portable X-Ray Fluorescence (XRF) device manufactured by Heuresis, Inc., of Burlington, Massachusetts (Serial #2320),to detect the presence of lead within the paint films and other finished surfaces (stains, varnishes, and shellacs). The device bombards the testing surface with X-ray energy, generated by a radioactive source. The energy excites electrons in the testing surface causing them to emit X-Ray energy. The X-Ray energy emitted by the electrons is analyzed by the XRF device. Based on analysis of the X-ray energy emitted by the electrons, the device is able to determine the presence and concentration of an element, in this case Lead, in the testing surface. Results are reported in milligrams per square centimeter. Lead based paint containing films were detected during the inspection. Components with Lead Based Paint and approximate quantities are listed in Table 3. The lead based paint analytical data sheets are included in Appendix II of this report.

Table 3 – Lead Based Paint Components
Air Traffic Control Tower
Trenton-Mercer Airport
West Trenton, NJ

Material	Substrate	Location
Exterior Walls	Metal	Building Exterior
Stairwell Railing	Metal	6th Floor Cab
Door Frame	Metal	Main Entrance

SECTION 4.0 UNIVERSAL WASTE INVENTORY

EC also inventoried universal waste in the Air Traffic Control Tower as part of the assessment. The identified materials are included in the Table below.

Table 4 – Universal Waste Inventory
Air Traffic Control Tower
Trenton-Mercer Airport
West Trenton, NJ

Material	Location	Quantity
Mercury Thermostats	Throughout	12
Fluorescent Light Bulbs	Throughout	150
Fluorescent Light Ballasts	Throughout	60
HVAC Units and Window Air Conditioners (Refrigerant)	Throughout	30
Refrigerator	2nd Floor	1
Fire Extinguishers – Dry Chemical, Carbon Dioxide and Water	Throughout	10
Batteries, Emergency Lights and Exit Signs	Throughout	20
Consumer Electronics (Computers, Monitors, Printers, etc.)	Throughout	50
<5 Gallon Containers of Cleaning Solution and Chemicals	Throughout	50

Between 1980 and 1991, Di(2-ethylhexyl)(phthalate) (abbreviated DEHP) was utilized in place of PCBs for fluorescent light ballasts, and has been classified by the USEPA as a probable human carcinogen and is under the jurisdiction of Superfund laws. The means of destruction and disposal is the same for both. In addition, transformer oils are known to contain PCBs. Ballasts and transformer oils should be

transported and disposed/recycled in accordance with United States Department of Transportation (USDOT); USEPA Toxic Substance Control Act (TSCA); and State of New Jersey, Department of Environmental Protection, (DEP) requirements.

Fluorescent lamps and mercury containing lamps contain heavy metal vapors, such as mercury, and should be collected and recycled during the construction activities. All mercury containing items, such as gauges and thermostats, should be removed intact and placed into a five (5) gallon bucket, with required warning and transportation labels. These should be transported and disposed/recycled in accordance with United States Department of Transportation (USDOT); USEPA Toxic Substance Control Act (TSCA); and State of New Jersey, Department of Environmental Protection, (DEP) requirements.

Refrigerant from Heating, Ventilating and Air Conditioning (HVAC) units and refrigerator units are assumed to contain Chlorofluorocarbons (CFCs). The CFCs should be extracted, collected and recycled, if these items are scheduled to be included with interior demolition work associated with renovations. Emergency light batteries including other identified lead acid batteries and NiCad batteries associated with battery back-up sources, radios, portable power washers should be removed, packaged for protection and transported to a recycling facility.

In accordance with the State of New Jersey, Department of Environmental Protection, (DEP) the disposal of consumer electronics, such as computers, telefacsimiles, televisions, any device that contains electrical circuitry (such as identified vintage electrical panels/circuits, air purifiers, microwaves, radio receivers, etc.), are included under the Universal Waste Rule (UWR). Such items may contain batteries, mercury, PCBs, cadmium, etc. A waste generator is identified by the UWR as either a small (less than 11,000 pounds of UWR at any given time) or large quantity handler (greater than 11,000 pounds of UWR at any given time). Therefore, all electronics scheduled for disposal should be collected, packaged in leak tight containers, labeled as "Universal Waste – Consumer Electronics," and transported to a Class D recycling center. A solid or hazardous waste transporter registration is only required when the universal waste is being shipped to a RCRA Treatment, Storage, or Disposal Facility (TSDF) for treatment or disposal, instead of recycling. Large quantity waste generators are also required to have a USEPA Identification Number and provide notification to the DEP.

Containerized fluids, fuels, coolants, paints, cleaning agents, solvents, etc., should be appropriately packaged, and where applicable grouped together, for transport to an alternate building/facility for use/reuse, recycling and/or disposal. Be advised that not all containers of products were inventoried as part of the study.

SECTION 5.0 PROJECT LIMITATIONS/DISCLAIMERS

The Client should be advised that quantities referenced herein are estimates/approximations. EC made every effort, inclusive of selective demolition, to access and sample all suspect hazardous materials. Where present, these materials were sampled in accordance with applicable Federal and State Regulations. EC does not claim that hidden materials may not still be present and inaccessible on, within, or beneath the various building components. EC does, however, assure that due diligence was observed in performing sampling as generally recognized by industry practices.

Should a previously unidentified suspect hazardous material be uncovered during demolition, activities should cease until the composition of the material is determined through sampling and analysis in accordance with 40 CFR, Part 763, and N.J.A.C. 8:60 and 12:120 for asbestos, inclusive of utilizing

USEPA accredited Asbestos Building Inspectors to collect the appropriate number of samples and an AIHA accredited laboratory that is a NVLAP participant.

EC does assure that due diligence was observed in performing sampling by generally recognized industry sampling practices.

SECTION 6.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of our assessment, EC offers the following recommendations.

- Employ a USEPA accredited Asbestos Project Designer to develop Plans and Specifications for the asbestos abatement prior to demolition.

- Utilize a New Jersey Department of Labor licensed Asbestos Contractor to abate the asbestos containing materials prior to demolition in accordance with federal and New Jersey requirements for asbestos abatement in public buildings.

- Perform air monitoring in accordance with federal and New Jersey requirements for asbestos abatement in public buildings. EC recommends daily air monitoring during abatement activities in addition to clearance air monitoring at the completion of abatement.

- Should any previously unidentified suspect materials be discovered during the renovation process, all work should cease until the materials are sampled by an accredited asbestos building inspector.

- Identified universal waste materials should be handled and disposed of in accordance with applicable regulatory requirements. The renovation design documents should delineate these requirements as they pertain to the materials identified in the building.

- Lead safe work practices specifications should be included in the renovation design documents. As per OSHA, the Contractor is required to have a site-specific Lead Health and Safety Plan. The Lead Health and Safety Plan shall include worker protection, engineering controls and decontamination procedures, as outlined in 29 CFR, Part 1926.62. In addition, as required by OSHA, individuals who will disturb Lead based paint shall be provided exposure monitoring by the Contractor.

Summary Test Report for Asbestos Analysis of Bulk Materials in Accordance with N.J.A.C. 8:60 and 12:120

Analyst(s):

Colin Slattery	TEM Grav. Reduction (28)
Laurel Elkin	PLM (26)
Marc Williams	PLM (15)
Shruti Patel	PLM (37)
Susan Pollack	PLM (13)

Reviewed and approved by:

C. Michael Slattery, Lab Manager
or Other Approved Signatory

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This is a summary report; official reports are available on LabConnect or upon request and relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Piscataway, NJ NYS ELAP 11423, NVLAP Lab Code 101048-2, NJ NELAC 12037, Philadelphia 289, CT PH-0266

1.0 INTRODUCTION

1.1 Purpose

Prestige Environmental, Inc. conducted this Phase I Environmental Site Assessment ("Phase I ESA") for the Trenton-Mercer Airport ("TTN") in accordance the American Society for Testing and Materials procedures (ASTM E1527-21). This Phase I ESA was performed to identify potential environmental issues at the proposed new location of the replacement Air Traffic Control Tower ("ATCT") located within the TTN property in Trenton, Mercer County, New Jersey ("Area of Disturbance/Subject Property Area").

This Phase I ESA was completed in order to identify the presence of the following:

- ***Recognized Environmental Conditions ("RECs")***, which are defined as the presence, or likely presence, of any hazardous substances or petroleum products in, on, or at a property due to any release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment.
- ***Historical Recognized Environmental Conditions ("HRECs")***, which are past releases of hazardous or petroleum products that have occurred in connection with the property and have been addresses to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any controls or use limitations
- ***Controlled Recognized Environmental Conditions ("CRECs")***, are RECs that have resulted from past releases of hazardous substances or petroleum products that have been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of engineering controls, institutional controls, and/or activity/use limitations.
- ***De minimis conditions*** "generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies." For reporting purposes, Prestige Environmental, Inc. defines "environmental concerns" as de minimis conditions and non-scope consideration for which further action is recommended.

This Phase I ESA is a non-intrusive desktop study and field review of environmental records and previous and present land use. It includes a

historical search, environmental agency contacts, interviews and a site reconnaissance.

1.2 Scope of Services

The results of this assessment are based upon a site reconnaissance conducted on July 12, 2023, and historic research and activities conducted by Prestige Environmental, Inc. which included:

1. Reviewed environmental databases radius map report for the Site and surrounding areas provided by Environmental Data Resources Inc. ("EDR") (Ref. **Appendix 1**)
2. Reviewed historical Sanborn® fire insurance maps for the subject Site and surrounding area provided by EDR (Ref. **Appendix 2**)
3. Reviewed historical aerial photographs of the Site and surrounding area provided by EDR (Ref. **Appendix 3**)
4. Reviewed historical topographic maps of the Site and surrounding area provided by EDR (Ref. **Appendix 4**)
5. Submitted requests pursuant to Open Public Records Act ("OPRA") to the New Jersey Department of Environmental Protection ("NJDEP") (Ref. **Appendix 5**)
6. Engaged EDR to search the City Directory Abstract for historical addressees at the property (Ref. **Appendix 6**)
7. Reviewed vapor encroachment analysis report for the site and surrounding areas provided by EDR (Ref. **Appendix 7**)
8. Completed interviews and reviewed provided documents (Ref. **Appendix 8**)

The results of this assessment are presented in the following sections.

1.3 Assumptions

Information provided to Prestige Environmental, Inc. regarding site operations, conditions and historical data are assumed to be correct and complete. Prestige Environmental, Inc. assumes no responsibility for hidden or latent conditions or misrepresentation by the property owner, its representatives, public officials or any authority consulted in connection with the compilation of this report.

Prestige Environmental, Inc. assumes that all information provided by Environmental Data Resources, Inc. ("EDR") regarding the regulatory status of

facilities within the approximate minimum search distance is complete, accurate and current.

1.4 Limitations and Exceptions

This Phase I ESA reflects conditions that were visibly evident in those areas where access was available on July 12, 2023, during Prestige Environmental, Inc.'s site reconnaissance. The assessment offers both information about the Site and the operations performed on the Site. Visual inspection was limited to those areas of the Site that were readily visible during the site reconnaissance.

This report presents information on the potential for contamination of the Subject Property but does not confirm it. Prestige Environmental, Inc. cannot warrant or guarantee the Subject Property suitable for any particular purpose or certify is as "clean".

1.5 Reliance

This report has been prepared for the Client designated on the cover page of the Phase I ESA. It is confidential and proprietary. No third party may rely on the information contained herein without Prestige Environmental, Inc.'s written permission.

2.0 SITE DESCRIPTION

2.1 Property Description

2.1.1 Location & Dimensions

The Subject Area includes the proposed replacement Air Traffic Control Tower ("ATCT") location, located within the Trenton-Mercer Airport ("TTN") property, in Trenton, New Jersey. It is identified as being part of Block: 373, Lots: 9 and 9.01 on the local tax map. The total area of the Subject Property is approximately 204,032 feet^2.

The TTN property is shown on the Pennington, NJ USGS 7.5-minute Quadrangle Map (Ref. **Figure 1**) at approximately 40°16' 40.26 north latitude and 74° 48' 40.22" west longitude. **Figure 2** depicts the Phase I ESA study area.

The replacement ATCT is to be located in the quadrant directly opposite the airport terminal on a portion of the former Site of the Army National Guard Hanger complex. Access to the tower will be provided via a proposed 30' wide access road connected to Upper Ferry Road. The proposed water, gas and sewer lines will be placed within the access road.

The adjoining properties consist of other airport uses and commercial facilities. The closest commercial property located to the south of the New Jersey National Guard Area, is Silva Guard located at 299 Upper Ferry Road, Ewing, NJ. Silva Guard is a landscaping services company. Their property consists of landscaping equipment, fertilizer, insect control chemicals and tree cuttings.

2.1.2 Utilities

The area of the proposed ATCT is currently vacant and is not served by any utilities. The proposed water, gas and sewer lines will be placed within the new access road for the ATCT.

2.2 Physical Setting

The Subject Property geology was reviewed through available information from the US Department of Agriculture, US Fish and Wildlife Services, Soil Conservation Service, NJDEP and the USGS 7.5-minute topographic map of Pennington, New Jersey. The results of the desktop review are provided in the sections below.

2.2.1 Surface Topography & Surface Water Drainage

The Site's ground surface is at an elevation of approximately 186 feet above mean sea level ("msl"). The topography of the Site is relatively flat but slopes slightly towards the southeast.

2.2.2 Wetlands

Based on review of information obtained from the National Wetlands Inventory, the Subject Site does not appear to be a designated wetland area. However, a comprehensive wetlands survey would be required to formally determine actual wetlands on the Subject Property.

2.2.3 Geology

The Subject Site is located within the Piedmont Province, near the boundary of the Coastal Plain. This area is mostly underlain by slightly folded and faulted sedimentary rocks of Triassic and Jurassic age and igneous rocks of Jurassic Age. Within the Trenton area, there are small bands of highly metamorphosed rocks ranging in age from Middle Proterozoic to Cambrian.

Pursuant to the United States Department of Agriculture ("USDA") Natural Resources Conservation Service Web Soil Survey online database, the Subject Property is mapped within the Quakertown silt loam (QukB) with 2 to 6% slopes and Udorthents bedrock substratum (UdbB) with 0 to 8% slopes.

2.2.4 Groundwater

Based on the topographic contour and the nearest river being the Delaware River which is located approximately 1.6 miles southeast of the Subject

Property, the regional groundwater flow appears to be generally toward the southeast. The West Branch Shabakunk Creek is also located to the east of the Subject Property area. Due to the local variations of groundwater flow, the actual groundwater flow at the Site may fluctuate.

2.2.5 Data Failures

According to ASTM E 1527-21, a data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met. No data failures were encountered during this Phase I ESA.

2.3 Site Ownership History and Operations

Trenton-Mercer Airport ("TTN") was previously known as Mercer County Airport and Skillman Airport. It has been a public airport since 1929. The existing Air Traffic Control Tower ("ATCT") was built in 1964.

The Subject Property Area is currently developed with helicopter landing pads, motor pool, concrete refueler truck parking pads and access roads. The Subject Property Area was formerly utilized as helicopter landing pads, aboveground and underground fuel storage, aircraft fueling station, refueling parking area, concrete wash pads and a motor pool. A former exterior hazardous waste/chemical storage shed was located at the northern most refueler truck parking pad within the proposed ATCT property area. It was removed in 2008.

The Subject Property Area falls within the TTN and is currently used by NJ State Police along with the Army National Guard. The tenant currently utilizes the former helicopter landing pads as refueling stations and the motor pool to park military vehicles.

Historical aerial photographs indicate that the Airport Property was initially utilized for agricultural purposes until the early 1940's. The Airport Property was first developed with runways and taxiways in 1947. The National Guard Buildings were first observed in 1948. The helicopter landing pads, runway, associated access roads and parking lot located within the Area of Disturbance were first observed in 1984.

2.4 Materials & Substances

During the site reconnaissance conducted on July 12, 2023, no drums or containers were observed within the Subject Property area.

2.5 Processes

2.5.1 Operations

The area of the proposed replacement Air Traffic Control Tower ("ATCT") is currently developed with helicopter landing pads, motor pool, concrete refueler truck parking pads and access roads. The Subject Property Area is owned by the Trenton-Mercer County Airport and is currently used by the NJ State Police along with the Army National Guard. The tenant currently utilizes the former helicopter landing pads as refueling station and the motor pool to park military vehicles.

2.5.2 Waste Storage, Treatment & Disposal

A former exterior hazardous waste/chemical storage shed was located at the northern most refueler truck parking pad within the proposed ATCT property area. It was removed in 2008.

2.5.3 Sewage Discharge and Disposal

The Subject Property area is not connected to any sewer. It was noted that the adjacent property is serviced by the Ewing Lawrence Sewerage Authority.

2.5.4 Wastewater Generation and Disposal

A former oil/waste separator was located to the south of the service building. Further research indicated that it was connected to the concrete wash pad at the Subject Property. The excess discharge was noted to be released into a storm sewer that passed through the proposed road alignment and discharged to the adjacent West Branch Shabakunk Creek.

2.5.5 Stressed Vegetation

No stressed vegetation was observed during the site reconnaissance conducted on July 12, 2023.

2.5.6 Evidence of Releases

Several locations of staining were observed throughout the Subject Property Area during the July 12, 2023 site reconnaissance.

2.5.7 Wells Not Previously Listed

Potable wells were not observed during the site reconnaissance conducted on July 12, 2023.

Several monitoring wells were observed during the site reconnaissance. Further research from the August 2012 Kleinfelder Site Investigation ("SI") and Response Action Outcome ("RAO") Report indicated that in August 2008, six (6) monitoring wells which were previously installed onsite to evaluate the tank closures, were abandoned as required by the April 2001 No Further Action

("NFA") Letter. No further information was found to document the installation and or testing results of the wells.

2.5.8 Stormwater/Surface Water Drainage

Stormwater flows east towards the West Branch Shabakunk Creek.

2.5.9 Pits, Ponds or Lagoons

A stormwater retention pond is located to the east of the Subject Property Area. It is connected to the West Branch Shabakunk Creek.

2.5.10 Odors

No evidence of adverse or suspicious odors were detected during the site reconnaissance conducted on July 12, 2023.

2.5.11 Hazardous Materials

No hazardous substances were observed during the site reconnaissance conducted on July 12, 2023.

2.5.12 Drains and/or Sumps

Four (4) concrete refueler truck parking spots were located on the southern corner of the Subject Property Area, each had a water drain valve. Further research indicated that the drains discharge to the adjacent West Branch Shabakunk Creek via one of the two outfalls.

2.5.13 Polychlorinated Biphenyls (PCBs)

Under the Federal Toxic Substance Control Act (TSCA), unmarked electrical equipment, unless indicated otherwise, can be assumed to be PCB-contaminated. TSCA defines "PCB-contaminated electrical equipment" as containing a dielectric fluid and/or cooling oil with between 50 and 500 parts per million (ppm) PCBs. Transformers containing over 500 ppm PCBs are called "PCB transformers". There are no restrictions on the use of PCB containing electrical equipment mandated by TSCA. However, "PCB transformers" are subject to specific requirements that include use restrictions, servicing restrictions, quarterly inspections, marking requirements, record keeping and specific disposal procedures. Potential "PCB transformers" may represent environmental concerns from possible spills or leaks of dielectric and/or cooling oils from the transformers. A threat to public health and safety also exists if a PCB-containing transformer catches fire.

No PCB- containing equipment was observed during the July 12, 2023 site reconnaissance.

2.6 Bulk Liquid Storage Vessels

During the July 12, 2023 site reconnaissance two (2) concrete pads with minor staining were observed to the southeast of the truck fueling parking spots. Further research indicated that the pads were the former location of two (2) aboveground storage tanks ("ASTs"). The concrete pads are located to the east of the proposed Access Road and utility lines.

A sign labeled "Potential Spill Site Oil Water Separator 1" was observed to the north of the storage building. The Oil Water Separator ("OWS") is located adjacent to the Maintenance Building and to the northeast of the aircraft wash pad. The sign indicated that OWS 1 consists of a 550-gallon UST which contains waste oil and JP-8 fuel from aircraft maintenance activity. It was also noted that surface spills would flow to the east towards the storm drain and into the storm sewer which crosses the proposed access road and discharges into the South Branch of Shabakunk Creek. Any underground spills would be secondary contained or leak into the soil.

Based on the information provided by Felipe S. Conteras, P.E., Vice President of Kleinfelder, one (1) 10,000-gallon heating oil (No. 2) underground storage tank ("UST") is currently in-use and one (1) 550-gallon flow-through process tank located to the south of the service building is of unknown status.

Further research indicated that the West Trenton Aviation Support Facility is assigned Program Interest ("PI") Number 000671. The following tanks were removed from the Site:

Tank No.	Capacity (gallons)	Contents	Removed
E1	2,000	Gasoline	July 1998
E2	2,000	Diesel	July 1998
E3	550	Waste Oil	June 2001
E4	10,000	Heating Oil	August 1998
E5	550	Waste Oil	June 2001
00E6	10,000	JP8 Aviation Fuel	January 1999
00E7	10,000	JP8 Aviation Fuel	January 1999

A No Further Action ("NFA")- unrestricted use was issued in April 2001 for one (1) 2,000-gallon diesel fuel UST, one (1) 2,000-gallon gasoline UST, one (1) 10,000-gallon fuel oil UST and two (2) 10,000-gallon JP-8 aviation fuel USTs.

Also, a Response Action Outcome ("RAO") for unrestricted use was issued in August 2012 for two (2) 550-gallon waste oil USTs.

2.7 Historical Sanborn® Fire Insurance Maps

Prestige Environmental, Inc. reviewed the Sanborn® fire insurance maps, searched by the United States Library of Congress Map Collection. EDR identified that no Sanborn® fire insurance maps were available for the Subject Property (Ref. **Appendix 2**).

2.8 Historical Aerial Photographs

Prestige Environmental, Inc. reviewed historical aerial photographs provided by the online Historic aerials database from 1931 to 2019. The following aerial photograph descriptions identify changes to the Subject Property and surrounding parcels as compared to the same photographs from the previous available year (Ref. **Appendix 3**):

1931 to 1940
The Subject Property and surrounding areas were observed to be utilized for agricultural purposes. A road was observed to the east of the Subject Property. No runways or buildings were present in the subject areas.

1947 to 1953
Runways and associated taxiways were observed in 1947. Two (2) hangars were observed on the northern airport property.

1961
The runways were observed to be extended.

1965
The existing Air Traffic Control Tower was observed on the western portion of the airport property.

1970
No significant changes were observed.

1974
Construction of the Air National Guard Hangar was observed on the southeastern portion of the airport property.

1984
Helipads, a runway, associated access roads and a parking lot were observed within the subject area. The existing terminal and National Guard buildings were observed on the airport property.

1989 to 2019
Additional airport development was depicted, but no significant changes to the subject areas were observed.

Review of the aerial photographs identified the Subject Property Area to have been utilized for agricultural purposes prior to the construction of the Airport, in the early 1940's.

2.9 Historical Topographic Maps

Prestige Environmental, Inc. reviewed the available historical topographic maps provided by the online Historic Topographic Map Report dated 1890 through 2019. The following summarizes the land use and topographic changes as depicted on the topographic maps (Ref. **Appendix 4**):

1890 to 1894
The airport property has no structures depicted. There is a road depicted to the east and a railroad depicted to the southeast of the Subject Property. The topographic contour at the airport property is to the southeast.

1906 to 1907
The airport property is improved with a road and four (4) structures.

1942 to 1943
The road and structures are no longer depicted on the airport property. The airport property is labeled as the "U.S Army Airfield (Under Construction)".

1954 to 1970
The airport property is labeled as "Mercer County Airport" with several runways and taxiways evident. The West Branch Shabakunk waterbody is observed on the eastern edge of the airport property.

1981
The airport property is improved with several structures, the location of one of the structures is similar to that of the existing Air Traffic Control Tower.

1995
The existing terminal and National Guard buildings were observed on the airport property.

2014
No roads or structures are depicted at the airport property. The property is also no longer labeled.

2016 to 2019
No roads or structures are depicted at the airport property, except for two (2) runways. The airport property is labeled "Trenton Mercer Airport".

Historical topographic maps did not identify RECs at the Property.

2.10 Historical City Directories

Prestige Environmental, Inc. obtained historical city directory listings from EDR to identify historical, commercial, and/or residential names and addresses associated with the Property and adjoining properties. City directories for the years 1972 through 2020 were reviewed **(**Ref. **Appendix 6).**

City Directory listings for adjacent properties included commercial business offices, retail and residential listings. From approximately 2000-2020 the 299 Upper Ferry Road property, adjacent to the Subject Property area was occupied by Silva Guard Lawn Care.

2.11 State File Review

Prestige Environmental, Inc. filed requests for documents for the subject Site with the New Jersey Department of Environmental Protection ("NJDEP") pursuant to the Open Public Records Act ("OPRA") (Ref. **Appendix 5**).

2.12 New Jersey GeoWeb and NJDEP DataMiner

Prestige Environmental, Inc. reviewed the New Jersey GeoWeb website and NJDEP DataMiner to locate potential environmental areas of interest within the Subject Property Area. As shown in **Figure 3**, the following two (2) facilities are located within Block: 373, Lot: 9.01.

The Naval & Marine Corps Res Center
PI No. 018708, Incident No. 94-04-20-0945
Two (2) 10,000-gallon No. 2 fuel heating oil underground storage tanks ("USTs") and one (1) 5,000-gallon waste oil UST were removed in April 1994. A No Further Action ("NFA")- A (unrestricted use) was issued in January 1998.

Mercer Armory & OMS
PI No. 000671, Incident No. 91-04-09-1438
The following underground storage tanks ("USTs"), were identified at the Site:

- E1: 2,000-gallon unleaded gasoline, removed
- E2: 2,000-gallon medium diesel fuel (No. 2-D), removed
- E3: 550-gallon waste oil, removed
- E4: 10,000-gallon heating oil (No. 6), removed
- E5: 550-gallon waste oil, out of service
- 00E6: 10,000-gallon aviation fuel, removed
- 00E7: 10,000-gallon aviation fuel, removed
- 00E8: 10,000-gallon heating oil (No. 2), in-use

A no further action ("NFA")-A (unrestricted use) was assigned in 2001 for Incident No. 91-04-09-1438.

A response action outcome ("RAO")- unrestricted use was issued for the two (2) former 550-gallon waste oil USTs (E3 and E5) in August 2012.

A March 2015 Cathodic Protection Testing performed by ATS Environmental Services indicated that the oil/water separator and heating oil tank both passed.

A UST Facility Certification Questionnaire for the 2022 annual renewal of the in-use 10,000-gallon heating oil (No. 2) UST (00E8) indicated that the UST Facility Owner is the NJ Department of Military and Veteran's Affairs. The heating oil is utilized for on-site consumption. The Class A Operator was identified as Abigal Zorn (NJ Registration No. 339283531).

The NJDEP GeoWeb search also identified historic fill is present to the south of the Subject Property Area within portions of Block: 374, Lots: 1 and 5.01.

A Deed Notice for soil and Classification Exception Area ("CEA") for groundwater (PI No. 006048) to the south of the Subject Property Area are present. It is for the Naval Air Warfare Center located at 1440 Parkway Avenue (Block: 374, Lot: 4.02), Ewing, NJ. The historic fill, Deed Notice and CEA are located outside of the Subject Property Area (Ref. **Figure 4**).

2.13 Environmental Database Report Review

A search of state, federal and local agency databases was conducted by EDR. The EDR environmental database report (Ref. **Appendix 1)** generated information regarding the Subject Property and surrounding properties which are or have been regulated, tracked, or investigated under specific federal or state environmental programs.

TABLE 1: EDR Database Search

Database	Description	Distance (Miles)	No. of Sites
SEMS-ARCHIVE	Superfund Enterprise Management System Archive	0.5	1
CORRACTS	Corrective Action Report	1.0	2

Based on the listed distance, presumed hydrogeologic relationships and/or current regulatory statuses, no regulated facilities are suspected to present environmental concerns to the Subject Property.

Additional information regarding each of the individual properties identified in the databases listed above is provided in **Appendix 1.**

2.14 Vapor Encroachment Screening (VES)

Prestige Environmental, Inc. performed a Vapor Encroachment Screen ("VES"). The purpose of the VES is to conduct an initial screen to determine if a Vapor Encroachment Condition ("VEC") exists in connection with the Subject Property. A VEC is defined as the presence or likely presence of chemical(s) of

concern ("COC") vapors in the subsurface (vadose zone) of the Subject Property caused by the release of vapors from contaminated soil and/or groundwater either on or near the Site.

Based on a review of the EDR report, vapor intrusion is unlikely to be an issue of concern in connection with the Subject Property. The EDR Vapor Encroachment Screen report (Ref. **Appendix 7**) was used to identify possible Vapor Encroachment Conditions ("VECs") from potential off-site sources located within a 100-foot radius of the Property that could impact on-site conditions. Based on a review, vapor intrusion is unlikely to be an issue of concern in connection with the existing structures on the Subject Property.

2.14 Past Environmental Reports

The following reports were provided to Prestige Environmental, Inc. for review (Ref. **Appendix 8**).

August 2012, Site Investigation Report and Remedial Action Outcome, prepared by Kleinfelder East, Inc. (Kleinfelder)

Kleinfelder was contracted by the New Jersey Department of Military and Veterans Affairs to prepare the report which summarized the environmental activities conducted for the two (2) 550-gallon waste oil underground storage tanks ("USTs") known as E3 and E5 at the West Trenton Aviation Armory property located at the Mercer County Airport on Scotch Road, West Trenton, Mercer County, NJ. It was noted that the NJDEP previously granted an NFA approval for former USTs E1, E2, E4, 00E6 and 00E7, but there was no documentation found concerning the removal of USTs E3 and E5.

A geophysical investigation was conducted to confirm that both USTs were no longer present at the Site. A soil boring investigation was also performed to confirm that subsurface soils haven't been impacted at both locations. The soil analytical results indicated waste oil specific compounds were either not detected or were detected at concentrations below the NJDEP DIGWSRS. Therefore, a response action outcome ("RAO") was submitted in conjunction with the Site Investigation Report ("SIR").

May 2019, Phase I Environmental Site Assessment, Existing and New Terminal and Aircraft Rescue and Firefighting Buildings, prepared by Urban Engineers, Inc. (Urban)

Urban performed a Phase I Environmental Site Assessment ("Phase I ESA") of the existing terminal building and aircraft rescue and firefighting (A.R.F.F) building as well as the locations of the proposed terminal and A.R.R.F buildings, located within the TTN property in Trenton, New Jersey. There were

two (2) study areas in the assessment; the TTN Terminal and Existing A.R.F.F Area (West Area) and the proposed new A.R.F.F Building (East Area).

The East Area is located adjacent to the New Jersey National Guard building, in the open space quadrants between Runway ends 34 and 24. The area is completed vegetated.

The Phase I ESA identified five (5) recognized environmental conditions ("RECs"):

- REC No. 1- Fueling, Maintenance and Aircraft Operations
- REC No. 2- Historic Fill
- REC No. 3- Historic Firefighting Drills
- REC No. 4- Potential Underground Storage Tank
- REC No. 5- Reported NJ Spills & Releases

November 2020, Phase II Environmental Site Assessment, Existing and New Terminal and Aircraft Rescue and Firefighting Buildings, prepared by Urban Engineers

As the Subject Property Area is within close proximity to the proposed new A.R.F.F Building (East Area), a summary of the Phase II investigation within that area is summarized below.

Six (6) soil borings (ARRF-1 through ARFF-6) were completed in the vicinity of the proposed excavation area associated with the new A.R.F.F building. Two (2) soil samples were collected at each boring location.

Soil analytical results were compared to NJDEP Non-Residential Direct Contact (NRDC) Soil Remediation Standards and NJDEP Impact to Groundwater (IGW) Soil Screening Levels.

The table below summarized Urbans findings within the proposed A.R.F.F. building area.

TABLE 4-1: NJDEP STANDARD AND SCREENING LEVEL EXCEEDANCES (NEW ARFF AREA)

Sample Location	Depth (FT)	Constituent	Result (mg/kg)	NRDC Standard (mg/kg)	IGW (mg/kg)
ARFF-1A	1	Benzo(a)anthracene	16	17.0	**0.80**
		Benzo(a)pyrene	13	**2.0**	**0.20**
		Benzo(b)fluoranthene	16	17.0	**2.0**
		Dibenzo(a,h)anthracene	2.5	**2.0**	**0.80**
		Indeno[1,2,3-cd]pyrene	7.8	17.0	**7.0**
ARFF-1B	5	Benzo(a)anthracene	4.5	17.0	**0.80**
		Benzo(a)pyrene	4.2	**2.0**	**0.20**
		Benzo(b)fluoranthene	4.8	17.0	**2.0**
		Dibenzo(a,h)anthracene	0.84	**2.0**	**0.80**
ARFF-2B	7	Arsenic	28	**19**	**19**
ARFF-5B	8	Arsenic	21	**19**	**19**

Standard/Screening Level in **bold** is exceeded.

Urban determined that the polycyclic aromatic hydrocarbons ("PAHs") exceedances were isolated to an area which was historically filled due to the road alignment of Scotch Road in the late 1950's. Also, elevated concentrations of Arsenic were attributed to historic fill or slightly higher naturally occurring background concentrations.

Additional sampling and analysis were recommended to delineate the extent of the PAH and Arsenic impact within the proposed A.R.R.F area. It was also recommended that a soil and material handling plan be developed and included as part of the construction documents and specifications.

2.15 NJ Industrial Site Recovery Act (ISRA) Applicability

Effective as of December 31, 1983, and amended on June 16, 1993, the Industrial Site Recovery Act (ISRA) preconditions transfer of ownership or closing of operations at certain commercial and industrial properties to assure that the environmental integrity of these properties was evaluated. Since 1997, sites that operate under certain North American Industry Classification System (NAICS) numbers, representative of potential activities involving storage, use, generation, and/or disposal of hazardous substance or wastes, must comply with the requirements of ISRA prior to sale or transfer of ownership of the property, or closing of operations at such locations. The NAICS industry codes which define establishments based on the activities in which they are primarily engaged were revised in 2002. Based on the available information and the current use, ISRA is not applicable to the Site.

2.16 Environmental Permits

No records of environmental permits for the Site were identified.

2.17 Violations

No records of environmental violations at the Site were identified.

2.18 Non-Indigenous Fill Materials

There is a potential for non-indigenous fill to have been placed within the Subject Property Area.

2.19 Site Reconnaissance

Prestige Environmental, Inc. conducted a site reconnaissance of the project area and surrounding areas on July 12, 2023. Photographs documenting the site reconnaissance are attached.

Table 2- Site Reconnaissance

Environmental Observations	Location
Hazardous Substances & Petroleum Products	None
Aboveground Storage Tanks (AST)	Two (2) concreted pads to the southeast of the truck fueling parking spots, staining observed
Underground Storage Tank (UST)	Oil/water separator to the south of the service building
Strong, Pungent or Noxious Odors	None
Drums & Containers	None
Stains or Corrosion	Stains were observed on the former helicopter landings pads, concrete pads and pavement
Drains and Sumps	Drains were observed at the four (4) concrete refueler truck parking pads
Pits, Ponds, Lagoons	Stormwater retention pond, to the east
Stressed Vegetation	None
Solid Waste	None
Wells (Monitoring and Potable)	Several Monitoring wells were observed, these were found to be installed to evaluate the tank closures and were abandoned as required by the April 2001 NFA Letter
Septic System	None
Polychlorinated Biphenyls (PCBs)	None

3.0 FINDINGS

This section summarizes the known or suspected environmental conditions related to the Subject Property Area based on the previously described records review, interviews and site reconnaissance.

Owner/Client Provided Information

According to interviews, completed questionnaires and client-provided information, the following environmental concerns were noted onsite:

- Proposed aircraft rescue and firefighting (A.R.F.F) buildings, located adjacent to the Subject Property Area to the east, has soil exceedances of metals and polycyclic aromatic hydrocarbons ("PAHs") attributed to historic fill
- 10,000-gallon heating oil (No. 2) underground storage tank ("UST"), in-use
- 550-gallon flow-through process tank, unknown status
- Two (2) 10,000-gallon aviation fuel aboveground storage tanks ("ASTs"), removed
- Former tanks located at the Subject Property, removed:
    - E1: 2,000-gallon gasoline
    - E2: 2,000-gallon diesel

  - E3: 550-gallon waste oil
  - E4: 10,000-gallon heating oil
  - E5: 550-gallon waste oil
  - 00E6: 10,000-gallon JP8 Aviation Fuel
  - 00E7: 10,000-gallon JP8 Aviation Fuel
- NFA- unrestricted use issued in April 2001 for one 2,000-gallon diesel fuel UST, one 2,000-gallon gasoline UST, one 10,000-gallon fuel oil UST and two (2) 10,000-gallon JP-8 Aviation Fuel USTs
- RAO- unrestricted use issued in August 2012 for two (2) 550-gallon waste oil USTs

Historic Maps

Based on a review of historic maps, the following was noted about the Subject Property Area:

- Airport Property initially utilized for agricultural purposes until the early 1940's
- The helicopter landing pads, runway, associated access roads and parking lot within the Subject Property Area were first observed in 1984
- Former exterior hazardous waste/chemical storage shed, removed in 2008

Agency Records and File Reviews:

The EDR environmental database report identified the following regulated sites were near the Subject Property Area:

- 1 SEMS-ARCHIVE site
- 2 CORRACTS sites
- 2 RCRA-SQG sites
- 5 RCRA-VSQG sites
- 42 NJ SHWS sites
- 4 NJ LUST sites
- 16 NJ HIST LUST sites
- 5 NJ UST sites
- 4 NJ INST CONTROL sites
- 1 NJ VCP site
- 3 NJ BROWNFIELDS sites
- 2 RCRA NonGen/NLR sites
- 1 FUDS site
- 1 US AIRS site
- 5 PFAS ECHO sites
- 1 PFAS PART 139 AIRPORT site
- 1 NJ DRYCLEANERS site
- 5 ISRA sites
- 1 NJ NJPDES site

Further research was conducted on the above-referenced Site based on the information provided by Felipe S. Conteras, P.E., Vice President of Kleinfelder, EDR database report, New Jersey GeoWeb website and NJDEP Dataminer.

Site Reconnaissance:
The following potential environmental concerns were noted during the site walk conducted of the project area on July 12, 2023:

- Stained pavement
- Monitoring wells
- Oil Water Separator
- Drains

4.0 CONCLUSIONS AND RECOMMENDATIONS

Prestige Environmental, Inc. performed a Phase I Environmental Site Assessment ("Phase I ESA") of the proposed replacement Air Traffic Control Tower ("ATCT") located within the Mercer-County Airport ("TTN") property, in Trenton, Mercer County, New Jersey ("Site"). The assessment was performed to characterize the existing environmental conditions to identify and evaluate recognized environmental conditions ("RECs"), controlled recognized environmental conditions ("CRECs"), historical recognized environmental conditions ("HRECs"), and de minimis conditions. The Phase I ESA is in conformance with the scope and limitation set forth in the American Society for Testing and Materials for Phase I ESAs (ASTM: E-1527-2021).

Based upon the EDR databases, observations made during the site reconnaissance and information presented in this report, Prestige Environmental, Inc. summarizes its results of the assessment as follows:

Recognized Environmental Conditions (RECs) are defined as the presence, or likely presence, of any hazardous substances or petroleum products in, on, or at a property due to any release to the environment; under conditions indicative of a release to the environment; or under conditions that pose a material threat of a future release to the environment. Based on the site inspection conducted on July 12, 2023, and review of historical documentation, this Phase I ESA has revealed evidence of the following RECs for the Site. The RECs locations are depicted in **Figure 5**.

- **REC-1: Former Underground Storage Tanks ("USTs")**:
  Based on the information provided by Felipe S. Conteras, P.E., Vice President of Kleinfelder, EDR Database Report, New Jersey GeoWeb website and NJDEP DataMiner identified the following two (2) facilities as located within Block: 373, Lot: 9.01.

Mercer Armoy and OMS/West Trenton Army Aviation Support Facility is assigned Program Interest ("PI") Number 000671. The following Underground Storage Tanks ("USTs") were identified at the Site:

Tank No.	Capacity (gallons)	Contents	Status
E1	2,000	Gasoline	Removed
E2	2,000	Diesel	Removed
E3	550	Waste Oil	Removed
E4	10,000	Heating Oil	Removed
E5	550	Waste Oil	Removed
00E6	10,000	JP8 Aviation Fuel	Removed
00E7	10,000	JP8 Aviation Fuel	Removed
00E8	10,000	Heating Oil (No. 2)	In-Use

It was also noted that one (1) 550-gallon flow-through process tank is located to the south of the service building, the status is unknown.

A No Further Action ("NFA")- unrestricted use was issued in April 2001 for one (1) 2,000-gallon diesel fuel UST, one (1) 2,000-gallon gasoline UST, one (1) 10,000-gallon fuel oil UST and two (2) 10,000-gallon JP-8 aviation fuel USTs. Also, a Response Action Outcome ("RAO")- unrestricted use was issued in August 2012 for two (2) 550-gallon waste oil USTs.

The Naval & Marine Corps Reserve Center is assigned PI No. 018708 and Incident No. 94-04-20-0945. Further research reviewed identified that two (2) 10,000-gallon No. 2 fuel heating oil underground storage tanks ("USTs") and one (1) 5,000-gallon waste oil UST were removed in April 1994. A No Further Action ("NFA")- A (unrestricted use) was issued by the NJDEP in January 1998.

Based on the documented completion of the remedial action no further investigation is warranted.

- **REC-2: Drains:**
  During the July 12, 2023 site reconnaissance, drains were observed at the four (4) concrete refueler truck parking pads. It was noted that the water from the drains likely discharged to the adjacent Shabakunk Creek via one of two outfalls. Considering that this area is located outside the Subject Property Area, no further investigation is warranted.

- **REC-3: Staining**
  During the July 12, 2023 site reconnaissance, several locations of minor staining were observed throughout the Subject Property Area. While spills/staining from historic operations have the potential to impact

subsurface conditions, no specific investigation to evaluate the impacts is warranted due to the ubiquity and diffuse nature of this REC. However, it is recommended that any potential subsurface impacts of this REC be taken into consideration while developing the Project Materials Management Plan ("MMP").

- **REC-4: Aboveground Storage Tanks ("ASTs"):**
  Two (2) former 10,000-gallon aviation fuel aboveground storage tanks ("ASTs") were located on concrete pads located to the southeast of the truck fueling parking spots. During the July 12, 2023 site reconnaissance, minor staining was observed. The concrete pads are located adjacent to the proposed Access Road and utility lines. As indicated in REC-3, it is recommended that any potential construction-related impacts of this REC be taken into consideration while developing the Project MMP.

- **REC-5: Former Hazardous Waste/Chemical Storage Shed**:
  A former exterior hazardous waste/chemical storage shed was located at the northern-most refueler truck parking pad within the proposed ATCT property area. It was noted to have been removed in 2008. No staining was observed in the vicinity. However, as indicated in REC-3, it is recommended that any potential construction-related impacts of this REC be taken into consideration while developing the Project MMP.

- **REC-6: Oil/Water Separator**:
  A former oil/water separator located to the south of the service building was noted to have been connected to the concrete wash pad. The excess discharge was released into a storm sewer that discharges to the adjacent West Branch of Shabakunk Creek.

  A sign labeled "Potential Spill Site Oil Water Separator 1" was observed to the north of the storage building. The Oil Water Separator ("OWS") is located adjacent to the Maintenance Building and to the northeast of the aircraft wash pad. The sign indicated that OWS 1 consists of a 550-gallon UST which contains waste oil and JP-8 fuel from aircraft maintenance activity. It was also noted that surface spills would flow to the east towards the storm drain and into the storm sewer which discharges into a creek. Any underground spills would be secondary contained or leak into the soil.

  A March 2015 Cathodic Protection Testing performed by ATS Environmental Services indicated that the oil/water separator ("OWS") passed inspection. No further documentation related to this OWS was available.

  Considering that the REC is located outside the Subject Property Area, no further investigation is warranted.

- **REC-7: Monitoring Wells:**
  During the July 12, 2023 site reconnaissance, several monitoring wells were observed. Further research from the August 2012 Kleinfelder Site Investigation ("SI") and Response Action Outcome ("RAO") Report indicated that in August 2008, six (6) monitoring wells which were previously installed onsite to evaluate the tank closures, were abandoned as required by the April 2001 NFA Letter. The provenance of the wells could not be ascertained and no further information to document the installation and/or testing results of the wells were available. Closure of these wells in accordance with N.J.A.C. 7:9D Well Construction and Maintenance; Sealing of Abandoned Wells is recommended.

- **REC-8: Historical Agricultural Operations:**
  Historical aerial photographs indicated that the Airport Property was initially utilized for agricultural purposes until the early 1940's. The Airport Property was first developed with runway and taxiways in 1947. The National Guard Buildings were first observed in 1948. The helicopter landing pads, runway, associated access roads and parking lot located within the Area of Disturbance were first observed in 1984. While pesticide-related impacts from historic agricultural operations have the potential to impact subsurface conditions, no specific investigation to evaluate the impacts is warranted due to the ubiquity and diffuse nature of this REC. However, it is recommended that any potential subsurface impacts of this REC be taken into consideration while developing the Project Materials Management Plan ("MMP").

- **REC-9: Soil Exceedances in the Proposed ARFF Location:**
  Urban Engineers (Urban) performed a Phase I and Phase II Environmental Site Assessment of the proposed aircraft rescue and firefighting (A.R.F.F) located within the eastern area of the TTN property. The East Area is located adjacent to the New Jersey National Guard building, in the open space quadrants between Runway ends 34 and 24. The area is vegetated.

  Soil sampling and analysis performed in November 2020 identified exceedances of polycyclic aromatic hydrocarbons ("PAHs") and arsenic. Urban determined that the PAHs exceedance were isolated to an area which was historically filled due to the road alignment of Scotch Road in the late 1950's. Also, elevated concentrations of Arsenic were attributed to historic fill or slightly higher naturally occurring background concentrations.

  Additional sampling and analysis were recommended to delineate the extent of the PAH and Arsenic impact within the proposed A.R.R.F area. It was also recommended that a soil and material handling plan be developed and included as part of the construction documents and specifications.

The exceedances detected may be attributed to agricultural use and no specific investigation to evaluate the impacts is warranted due to the ubiquity and diffuse nature of this REC. However, as indicated in REC-8, it is recommended that any potential subsurface impacts of this REC be taken into consideration while developing the Project MMP.

Controlled Recognized Environmental Conditions (CRECs) include the past release of any hazardous substance or petroleum product that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of engineering controls, institutional controls, and/or activity/use limitations. This Phase I ESA has revealed no evidence of CRECs for the Site.

Historic Recognized Environmental Conditions (HRECs) include the past release of any hazardous substance or petroleum product that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority, and/or meets the unrestricted use criteria established by a regulatory authority without subjecting the property to any controls or use limitations.

The New Jersey GeoWeb website search identified a Deed Notice for soil and Classification Exception Area ("CEA") for groundwater (PI No. 006048) to the south of the Subject Property Area. It is for the Naval Air Warfare Center located at 1440 Parkway Avenue (Block: 374, Lot: 4.02), Ewing, NJ.

As the Deed Notice and CEA are located well outside of the Subject Property Area no further investigation is warranted.

5.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Prestige Environmental, Inc. declares that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in 312.10 of 40 CFR 312.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed all appropriate inquires in conformance with the standards and practices set forth in 40 CFR Part 312.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/26/2023 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/06/2023 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Lists of Federal RCRA generators

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/06/2023 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-VSQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Very small quantity generators (VSQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-VSQG list, as provided by EDR, and dated 03/06/2023 has revealed that there are 5 RCRA-VSQG sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/06/2023 has revealed that there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

US AIRS: The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

A review of the US AIRS list, as provided by EDR, has revealed that there is 1 US AIRS site within

approximately 0.001 miles of the target property.

PFAS ECHO: Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. EPA has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

A review of the PFAS ECHO list, as provided by EDR, and dated 03/30/2023 has revealed that there are 5 PFAS ECHO sites within approximately 0.25 miles of the target property.

PFAS PART 139 AIRPORT: Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

A review of the PFAS PART 139 AIRPORT list, as provided by EDR, and dated 03/30/2023 has revealed that there is 1 PFAS PART 139 AIRPORT site within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

NJ ISRA: The ISRA process begins with determining if the Act applies to your type of business and transaction. The provisions of ISRA only apply to industrial establishments. What is an industrial establishment? The term "industrial establishment" refers to the type of business operations and transactions that would subject a facility to review under ISRA. An industrial establishment must meet each of the following three criteria: The place of business or real property at which such business is conducted, having a North American Industry Classification System (NAICS) code listed in N.J.A.C. 7:26 B - Appendix C subject to the specified exceptions and limitations. The place of business must have been engaged in operations on or after December 31, 1983; and The place of business must involve the generation, manufacture, refining, transportation, treatment, storage, handling, or disposal of hazardous substances or hazardous wastes.

A review of the NJ ISRA list, as provided by EDR, and dated 03/17/2023 has revealed that there are 5 NJ ISRA sites within approximately 0.5 miles of the target property.

Hazardous Waste Summary:

Waste Code: F001
Waste Description: The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F003
Waste Description: The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F005
Waste Description: The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Environmental Interest/Information System:

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	Ignitable Waste
Waste Code:	F001
Waste Description:	The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated

ROSS TRENTON LLC (Continued) **1014957067**

Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F005
Waste Description: The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Hazardous Waste Summary:

Waste Code: D001
Waste Description: Ignitable Waste

Waste Code: F002
Waste Description: The Following Spent Halogenated Solvents: Tetrachloroethylene, Methylene Chloride, Trichloroethylene, 1,1,1-Trichloroethane, Chlorobenzene, 1,1,2-Trichloro-1,2,2-Trifluoroethane, Ortho-Dichlorobenzene, Trichlorofluoromethane, And 1,1,2, Trichloroethane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F001, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F003
Waste Description: The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Tanks:
Tank Id: TANK-1
Tank Number: E1
Tank Status: **Removed**
Tank Status Date: 11/30/1993
Install Date: 01/01/1969
Tank Contents: Aviation Fuel
Tank Size: 20000
Tank Compliance: No
Overfill: Yes
Compliance Monitoring?: No
Overfill Protection: Yes
Spill Containment: No
Tank Wellhead Protection: Not reported
Tank/Pipe Construction Type: Pipe Bare steel
Tank/Pipe Construction Type: Tank Cathodically protected steel
Tank/Pipe Monitor: Pipe None
Tank/Pipe Monitor: Tank None

Tank Id: TANK-2
Tank Number: E2
Tank Status: **Removed**
Tank Status Date: 11/30/1993
Install Date: 01/01/1969
Tank Contents: Aviation Fuel
Tank Size: 20000
Tank Compliance: No
Overfill: Yes
Compliance Monitoring?: No
Overfill Protection: Yes
Spill Containment: No

JOHNSON & JOHNSON AVIATION (Continued) **1000320335**

Tank Wellhead Protection: Not reported
Tank/Pipe Construction Type: Pipe Bare steel
Tank/Pipe Construction Type: Tank Cathodically protected steel
Tank/Pipe Monitor: Pipe None
Tank/Pipe Monitor: Tank None

Tank Id: TANK-3
Tank Number: E3
Tank Status: Removed
Tank Status Date: 11/30/1993
Install Date: 01/01/1969
Tank Contents: Unleaded Gasoline
Tank Size: 3000
Tank Compliance: No
Overfill: Yes
Compliance Monitoring?: No
Overfill Protection: Yes
Spill Containment: No
Tank Wellhead Protection: Not reported
Tank/Pipe Construction Type: Tank Cathodically protected steel
Tank/Pipe Construction Type: Pipe Bare steel
Tank/Pipe Monitor: Pipe None
Tank/Pipe Monitor: Tank None

Hazardous Waste Summary:
Waste Code: D000
Waste Description: Not Defined

Waste Code: D001
Waste Description: Ignitable Waste

Waste Code: D002
Waste Description: Corrosive Waste

Waste Code: D006
Waste Description: Cadmium

Waste Code: D007
Waste Description: Chromium

Waste Code: D008
Waste Description: Lead

Waste Code: D009
Waste Description: Mercury

Waste Code: F001
Waste Description: The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F002
Waste Description: The Following Spent Halogenated Solvents: Tetrachloroethylene, Methylene Chloride, Trichloroethylene, 1,1,1-Trichloroethane, Chlorobenzene, 1,1,2-Trichloro-1,2,2-Trifluoroethane, Ortho-Dichlorobenzene, Trichlorofluoromethane, And 1,1,2, Trichloroethane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F001, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F003
Waste Description: The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent

US NAVAL AIR WARFARE CENTER/TRENTON (Continued) **1015735350**

Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F005
Waste Description: The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: U002
Waste Description: 2-Propanone (I) (Or) Acetone (I)

Waste Code: U061
Waste Description: Benzene, 1,1'-(2,2,2-Trichloroethylidene)Bis[4-Chloro- (Or) Ddt

Waste Code: U220
Waste Description: Benzene, Methyl- (Or) Toluene

Waste Code: U228
Waste Description: Ethene, Trichloro- (Or) Trichloroethylene

Waste Code:	D018
Waste Description:	Benzene
Waste Code:	D027
Waste Description:	1,4-Dichlorobenzene
Waste Code:	D039
Waste Description:	Tetrachloroethylene
Waste Code:	D040
Waste Description:	Trichlorethylene
Waste Code:	F001
Waste Description:	The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F002
Waste Description:	The Following Spent Halogenated Solvents: Tetrachloroethylene, Methylene Chloride, Trichloroethylene, 1,1,1-Trichloroethane, Chlorobenzene, 1,1,2-Trichloro-1,2,2-Trifluoroethane, Ortho-Dichlorobenzene, Trichlorofluoromethane, And 1,1,2,

EWING TWP INDUSTRIAL LAND - FORMER GENERAL MO (Continued) **1000229531**

Trichloroethane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F001, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F005
Waste Description: The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F006
Waste Description: Wastewater Treatment Sludges From Electroplating Operations, Except From The Following Processes: (1) Sulfuric Acid Anodizing Of Aluminum; (2) Tin Plating On Carbon Steel; (3) Zinc Plating (Segregated Basis) On Carbon Steel; (4) Aluminum Or Zinc-Aluminum Plating On Carbon Steel; (5) Cleaning/Stripping Associated With Tin, Zinc, And Aluminum Plating On Carbon Steel; And (6) Chemical Etching And Milling Of Aluminum.

Waste Code: F007
Waste Description: Spent Cyanide Plating Bath Solutions From Electroplating Operations.

Waste Code: F008
Waste Description: Plating Bath Residues From The Bottom Of Plating Baths From Electroplating Operations In Which Cyanides Are Used In The Process.

Waste Code: F009
Waste Description: Spent Stripping And Cleaning Bath Solutions From Electroplating Operations In Which Cyanides Are Used In The Process.

Waste Code: F010
Waste Description: Quenching Bath Residues From Oil Baths From Metal Heat Treating Operations In Which Cyanides Are Used In The Process.

Waste Code: F011
Waste Description: Spent Cyanide Solutions From Slat Bath Pot Cleaning From Metal Heat Treating Operations.

Waste Code: F012
Waste Description: Quenching Wastewater Treatment Sludges From Metal Heat Treating Operations In Which Cyanides Are Used In The Process.

Waste Code: F017
Waste Description: Not Defined

Waste Code: F018
Waste Description: Not Defined

Waste Code: P015
Waste Description: Beryllium

Waste Code: P029

EWING TWP INDUSTRIAL LAND - FORMER GENERAL MO (Continued) **1000229531**

Waste Description: Copper Cyanide (Or) Copper Cyanide Cu(Cn)

Waste Code: P030
Waste Description: Cyanides (Soluble Cyanide Salts), Not Otherwise Specified

Waste Code: P098
Waste Description: Potassium Cyanide (Or) Potassium Cyanide K(Cn)

Waste Code: P106
Waste Description: Sodium Cyanide (Or) Sodium Cyanide Na(Cn)

Waste Code: P121
Waste Description: Zinc Cyanide (Or) Zinc Cyanide Zn(Cn)2

Waste Code: U075
Waste Description: Dichlorodifluoromethane (Or) Methane, Dichlorodifluoro-

Waste Code: U123
Waste Description: Formic Acid (C,T)

Waste Code: U154
Waste Description: Methanol (I) (Or) Methyl Alcohol (I)

Waste Code: U159
Waste Description: 2-Butanone (I,T) (Or) Methyl Ethyl Ketone (Mek) (I,T)

Waste Code: U210
Waste Description: Ethene, Tetrachloro- (Or) Tetrachloroethylene

Waste Code: U220
Waste Description: Benzene, Methyl- (Or) Toluene

Waste Code: U226
Waste Description: Ethane, 1,1,1-Trichloro- (Or) Methyl Chloroform

Waste Code: U239
Waste Description: Benzene, Dimethyl- (I,T) (Or) Xylene (I)
